## Experimental Section

### Materials

A 2.0 M methylamine solution in tetrahydrofuran (THF) was purchased from Watanabe Chemical Industries. PVP-protected colloidal Pt (2 nm in particle size) was purchased from Tanaka Holdings Co., Ltd. All other chemicals and solvents were purchased from Kanto Chemicals Co., Inc. and used without further purification. **4,4'-MV4(PF<sub>6</sub>)<sub>8</sub>·5H<sub>2</sub>O**,<sup>1</sup> **5,5'-MV4(PF<sub>6</sub>)<sub>8</sub>·3H<sub>2</sub>O**,<sup>2</sup> [Ru(bpy)<sub>2</sub>(**5,5'-MV4**)](PF<sub>6</sub>)<sub>10</sub>·H<sub>2</sub>O,<sup>2</sup> 4,4'-dicarboxy-2,2'-bipyridine,<sup>3</sup> [Ru(**5,5'-ME2**)<sub>3</sub>](PF<sub>6</sub>)<sub>2</sub>·H<sub>2</sub>O (**5,5'-ME2** = 5,5'-bis(N-methylcarbamoyl)-2,2'-bipyridine),<sup>4</sup> *cis*-RuCl<sub>2</sub>(DMSO)<sub>4</sub><sup>5</sup> (DMSO = dimethyl sulfoxide), [Ru(bpy)<sub>3</sub>](NO<sub>3</sub>)<sub>2</sub>·3H<sub>2</sub>O,<sup>6</sup> and MV(NO<sub>3</sub>)<sub>2</sub><sup>6</sup> were synthesized as previously described.

**Synthesis of [Ru(4,4'-MV4)<sub>3</sub>](PF<sub>6</sub>)<sub>26</sub>·12H<sub>2</sub>O.** A solution of *cis*-RuCl<sub>2</sub>(DMSO)<sub>4</sub> (24 mg, 0.050 mmol) and **4,4'-MV4(PF<sub>6</sub>)<sub>8</sub>·5H<sub>2</sub>O** (0.490 mg, 0.195 mmol) in a water–ethanol mixture (1:1 v/v, 10 mL) was refluxed under Ar for 48 h, while the reaction progress was monitored spectrophotometrically. After cooling to room temperature, the reaction mixture was filtered to remove insoluble materials. To the filtrate was added water (ca. 5 mL), followed by concentration by evaporation in order to remove most of ethanol. To the resulting solution was added saturated aqueous NH<sub>4</sub>PF<sub>6</sub>, (ca. 0.5 mL), resulting in prompt deposition of the product as a reddish brown solid, which was collected by filtration. The crude product was purified on a Sephadex LH-20 column (ca. 60 cm) using acetonitrile:methanol (1:1 v/v) as an eluent. The first red band was collected and dried in vacuo to give a pure product as a dark red solid (yield: 251 mg, 63.7 %). <sup>1</sup>H NMR (CD<sub>3</sub>CN/TMS (TMS = tetramethylsilane), 20 °C, ppm): δ 9.02 (s, 6H), 8.91-8.83 (m, 48H), 8.43-8.38 (m, 48H), 7.92-7.87 (m, 12H), 7.70 (s, 6H), 7.06 (s, 6H), 6.66 (s, 6H), 4.83-4.61 (m, 30H), 4.41 (s, 36H), 3.81-3.64 (m, 24H), 2.77-2.61 (m, 12H); Anal. Calcd for C<sub>216</sub>H<sub>234</sub>F<sub>156</sub>N<sub>48</sub>O<sub>18</sub>P<sub>26</sub>Ru·12H<sub>2</sub>O (7876.79): C 32.94, H 3.30, N 8.54; found: C, 33.16; H, 3.21; N, 8.56, where the number of water solvate was calibrated based on the integrated intensity ratios of the <sup>1</sup>H NMR signals (averaged for three separately prepared samples).

**Synthesis of [Ru(5,5'-MV4)<sub>3</sub>](PF<sub>6</sub>)<sub>26</sub>·9H<sub>2</sub>O.** Prepared as described above for [Ru(4,4'-MV4)<sub>3</sub>](PF<sub>6</sub>)<sub>26</sub>·12H<sub>2</sub>O substituting **5,5'-MV4(PF<sub>6</sub>)<sub>8</sub>·3H<sub>2</sub>O** (495 mg, 0.195 mmol) for **4,4'-MV4(PF<sub>6</sub>)<sub>8</sub>·5H<sub>2</sub>O** (yield: 237 mg, 60.5 %). <sup>1</sup>H NMR (CD<sub>3</sub>CN/TMS, 20 °C, ppm) : δ 8.99-8.86 (m, 48H), 8.66 (m, 6H), 8.39 (m, 54H), 8.11-7.95 (m, 6H), 7.71-7.06 (m, 6H), 6.96-6.87 (m, 6H), 6.68-6.61 (m, 6H), 4.84-4.63 (m, 30H), 4.41 (s, 36H), 3.78-3.60 (m, 24H), 2.56-2.50 (m, 12H); Anal. Calcd for C<sub>216</sub>H<sub>234</sub>F<sub>156</sub>N<sub>48</sub>O<sub>19</sub>P<sub>26</sub>Ru·9H<sub>2</sub>O (7822.74): C 33.16, H 3.25, N 8.59; found: C 33.55, H 3.27, N 8.67, where the number of water solvate was calibrated based

on the integrated intensity ratios of the  $^1\text{H}$  NMR signals (averaged for three separately prepared samples).

**Synthesis of 4,4'-bis(N-methylcarbamoyl)-2,2'-bipyridine (4,4'-ME2).** To a solution of 2,2'-bipyridine-4,4'-dicarboxylic acid (0.16 g, 0.655 mmol) in thionyl chloride (10 mL) was added a drop of dry dimethylformamide (DMF) followed by refluxing for 2 h with stirring. After the reaction mixture was cooled to room temperature, thionyl chloride and DMF were removed under reduced pressure to give the bis(chlorocarbonyl) derivative, which was dissolved in dry THF (25 mL) followed by addition of a 2.0 M methylamine solution in THF (2.0 mL). The solution was refluxed for 5 h. The resulting yellow precipitate was collected by filtration, washed several times with water, and dried in vacuo (yield: 145 mg, 79.2 %).  $^1\text{H}$  NMR (DMSO- $d_6$ /TMS, 20 °C, ppm):  $\delta$  8.92 (d,  $J$  = 4.1 Hz, 2H), 8.86 (d,  $J$  = 4.8 Hz, 2H), 8.79 (s, 2H), 7.84 (dd,  $J$  = 4.8, 2.0 Hz, 2H), 2.84 (d,  $J$  = 4.1 Hz, 6H); ESI-TOF MS:  $m/z$  = 271.20  $[\text{M} + \text{H}]^+$  (Calcd for  $\text{C}_{14}\text{H}_{14}\text{N}_4\text{O}_2$ : 271.29); Anal. Calcd for  $\text{C}_{14}\text{H}_{14}\text{N}_4\text{O}_2 \cdot 0.5\text{H}_2\text{O}$  (279.30): C, 60.21; H, 5.41; N, 20.06; found: C, 60.50; H, 5.29; N, 19.78.

**Synthesis of  $[\text{Ru}(\mathbf{4,4'\text{-ME2}})_3](\text{PF}_6)_2 \cdot 2\text{H}_2\text{O}$ .** Prepared as described above for  $[\text{Ru}(\mathbf{4,4'\text{-MV4}})_3](\text{PF}_6)_{26} \cdot 12\text{H}_2\text{O}$  by reacting *cis*- $\text{RuCl}_2(\text{DMSO})_4$  (40.5 mg, 0.0836 mmol) and 4,4'-bis(N-methylcarbamoyl)-2,2'-bipyridine (**4,4'-ME2**) (93.4 mg, 0.334 mmol) in a water-ethanol mixture (1 : 1 v/v, 20 mL) under Ar for 20 h to give a product as a dark red solid (yield: 70.8 mg, 68.4 %).  $^1\text{H}$  NMR ( $\text{CD}_3\text{CN}/\text{TMS}$ , 20 °C, ppm):  $\delta$  8.91 (d,  $J$  = 2.0 Hz, 6H), 7.82 (d,  $J$  = 6.2 Hz, 6H), 7.68 (dd,  $J$  = 5.5, 2.0 Hz, 6H), 2.93 (d,  $J$  = 4.9 Hz, 18H); ESI-TOF MS:  $m/z$  = 1057.42  $[\text{M} - \text{PF}_6]^+$  (Calcd for  $\text{C}_{42}\text{H}_{42}\text{F}_6\text{N}_{12}\text{O}_6\text{PRu}$ : 1057.19),  $m/z$  = 456.11  $[\text{M} - 2\text{PF}_6]^{2+}$  (Calcd for  $\text{C}_{42}\text{H}_{42}\text{N}_{12}\text{O}_6\text{Ru}$ : 912.38); Anal. Calcd for  $\text{C}_{42}\text{H}_{42}\text{F}_{12}\text{N}_{12}\text{O}_6\text{P}_2\text{Ru} \cdot 2\text{H}_2\text{O}$  (1237.89): C, 40.75; H, 3.75; N, 13.58; found: C, 40.65; H, 3.73; N, 13.38.

### General Methods.

$^1\text{H}$  NMR spectra were acquired on a JEOL JNM-ESA 600 spectrometer. ESI-TOF mass spectra were recorded on a JEOL JMS-T100CS spectrometer. UV-vis and UV-vis-NIR spectra were recorded on Shimadzu UV-2600 and UV-3600 spectrophotometer, respectively. Luminescence spectra were recorded on a Shimadzu RF-5300PC spectrofluorophotometer. Emission decays were recorded on a HORIBA FluoroCube 3000USKU using a HORIBA N-470L diode laser (472 nm) as an excitation source. Luminescence quantum yields were determined using a Hamamatsu C9920-02 absolute photoluminescence quantum yield measurement system equipped with a 150 W Xe lamp coupled to a monochromator for wavelength discrimination, an integrating sphere as a sample chamber, and a Hamamatsu C10027-01 multichannel detector for

signal detection. Nanosecond laser flash photolysis experiments were carried out using a Unisoku TSP-1000M-03R system equipped with a Nd:YAG laser (Minilite II-10, Continuum, CA, USA) as a pump source and a 150 W Xe lamp (L2195, Hamamatsu) as a probe source. Transient absorption spectra were recorded using multichannel detector with a gated image-intensifier (C954603, Hamamatsu), while single-wavelength transient absorption traces were monitored using an amplified photomultiplier tube (R2949, Hamamatsu). Molar conductivity measurements were carried out at 20 °C in water using a TOA CM-20S conductometer with a TOA CG-511B conductivity cell having a cell constant of 0.969 cm<sup>-1</sup>. Analysis of multi-step ion-pair formation equilibria was carried out based on our published procedures.<sup>2</sup> Square wave voltammograms were recorded on a BAS ALS Model 6022D electrochemical analyser, using a three electrode system consisting of a platinum working electrode, a platinum wire counter electrode, and a Ag/Ag<sup>+</sup> reference electrode (0.249 V vs. SCE), where TBAH (tetra(n-butyl)ammonium hexafluorophosphate) was used as a supporting electrolyte and all potentials reported were standardized by simultaneously observing the Fc/Fc<sup>+</sup> couple (Fc/Fc<sup>+</sup> = 0.155 V vs. SCE).

**In Situ ESR Studies.** ESR spectra were acquired on a JEOL JES-FA200 ESR spectrometer equipped with a EFM 2000AX NMR field meter (ECHO Electronic Co. Ltd.) for field calibration, using a ES-LC12 quartz flat cell (60 mm x 10 mm x 0.3 mm) for aqueous sample measurements. The spectra of monoradical species (MV<sup>+</sup>•), in situ generated by photolysis, were measured under Ar atmosphere at room temperature by careful exclusion of O<sub>2</sub> which immediately quenches radicals (MV<sup>+</sup>• + O<sub>2</sub> → MV<sup>2+</sup> + O<sub>2</sub><sup>-</sup>•). Photolysis was performed using an Asahi Spectra MAX-303 300 W Xe lamp equipped with a visible mirror module (λ = 385-740 nm) with the light intensity diminished to 50% (ND filter). Radicals are also quite sensitive to the metallic impurities over the glassware surfaces since they can catalyze water reduction (2MV<sup>+</sup>• + 2H<sup>+</sup> → 2MV<sup>2+</sup> + H<sub>2</sub>). Therefore, the quartz cell was sufficiently cleaned by soaking in aqua regia prior to the use. The spin density of the monoradical site generated over the charge-separators was calibrated by measuring the ESR intensity of MV<sup>+</sup>• generated by photoirradiating the EDTA/[Ru(bpy)<sub>3</sub>]<sup>2+</sup>/MV<sup>2+</sup> solution under the same experimental conditions, where calibration also relied on the concentrations of monoradical separately determined by in situ absorption spectroscopy performed under the same conditions (Fig. S9). The concentration of the monoradical site in the charge-separators were determined by spectral deconvolution as noted above.

**Photochemical H<sub>2</sub> Evolution Experiments.** Visible light irradiation (400 < λ < 800 nm) was carried out using an ILC Technology CERMAX LX-300 Xe lamp (300 W) equipped with a

CM-1 cold mirror which suppresses UV and NIR irradiation. Photolysis was carried out in a Pyrex glass vial (ca. 20 mL in inner volume), immersed in a water bath thermostatted at 20 °C, and each photolysis solution (10 mL) was continuously purged with Ar (10 mL/min; STEC SEC-E40/PAC-D2 digital mass flow controller) with stirring. The vent gas was introduced into our computer-controlled automated gas chromatographic analysis line (Shimadzu GC-8A gas chromatograph equipped with a molecular sieve 5A column (2 m x 3 mm i.d.; 30 °C) with an Ar carrier), the details for which have been described elsewhere.<sup>7</sup>

**Molecular-Mechanics and Quantum-Mechanical Calculations.** Molecular modeling studies were carried out using SCIGRESS (version 2; Fujitsu Limited, 2009).<sup>8</sup> Energy-minimized structures were located using molecular mechanics calculations (MM3),<sup>9-11</sup> where electrostatic interactions were taken into consideration by approximating that two positive charges on each viologen cation are respectively located at the pyridinium nitrogen centres and a negative charge on each PF<sub>6</sub><sup>-</sup> anion at the phosphorous centre.

Density functional theory (DFT) calculations were performed using the Gaussian 09 package of programs<sup>12</sup> in order to understand the structural and spin-state candidates for the  $\pi$ -dimers given by stacking of singly reduced viologen derivatives. Calculations were also performed to simulate the UV-Vis-NIR absorption spectra of the candidates computed. For this purpose, we adopted a model compound given by condensation of N-acetyl-aspartic acid (CH<sub>3</sub>-CONH-CH(CH<sub>2</sub>-COOH)-COOH) and two equivalents of one-electron-reduced N-methyl-N'-(2-aminoethyl)-4,4'-bipyridinium cations (abbreviated as H<sub>2</sub>N-CH<sub>2</sub>-MV<sup>+</sup>); that is, CH<sub>3</sub>-CONH-CH(CH<sub>2</sub>-CONH-CH<sub>2</sub>-MV<sup>+</sup>)-CONH-CH<sub>2</sub>-MV<sup>+</sup>, noted as Asp-based (MV<sup>+</sup>)<sub>2</sub>. Calculations were also performed for the simplest model of a  $\pi$ -dimer given by stacking of one-electron-reduced N,N'-dimethyl-4,4'-bipyridinium cations, noted as non-derivatized (MV<sup>+</sup>)<sub>2</sub>. The structures were fully optimized using the M06 hybrid functional, developed by Truhlar *et al.*,<sup>13-15</sup> and the 6-31G\*\* basis set with the effects of solvation in water taken into consideration using polarizable continuum model (PCM).<sup>16-18</sup> We experienced that calculations using M06 with PCM afford quite reasonable geometries involving this type of weak  $\pi$ - $\pi$  stacking and/or bonding interactions. Spin-unrestricted UM06 theory was used for triplet states, while spin-restricted and -unrestricted methods (i.e., M06 and UM06) were respectively employed for closed- and open-shell singlet states. Particularly, UM06 calculations (Guess=Mix) in broken symmetry (BS) were performed for the open-shell singlet states. For such BS singlet-state calculations, spin contamination is exhibited by nonzero values for the spin-squared expectation value, defined with  $\langle S^2 \rangle = S(S+1)$ , where S is the molecular spin quantum number. Actually, the spin-squared expectation values after spin annihilation were in the range  $\langle S^2 \rangle = 0.0026-0.0703$ , confirming that spin contamination of the triplet state is

negligibly small. These support the validity of the BS approach for these open-shell singlet states without employing the spin-projected methods eliminating the redundant spin contaminations. For the non-derivatized  $(MV^+)_2$ , two types of stacking geometries, eclipsed and staggered ones, were realized for all three possible spin states with the triplet only 1–2 kcal/mol higher in energy. When the Asp-based  $(MV^+)_2$  was optimized for an eclipsed conformation, only the closed-shell singlet preserved the eclipsed conformation at the end of optimization, while the other two spin states resulted in slipped conformations of two  $MV^+$  moieties. When the Asp-based  $(MV^+)_2$  was optimized for the staggered conformation, all spin states preserved the conformation with the triplet similarly higher than the others in energy. All stationary points were characterized by their harmonic vibrational frequencies as minima. The unscaled frequencies were used to compute the zero-point vibrational energy corrections to the energies. For all the candidates computed, electronic excited states were calculated by the TD-DFT method as implemented in Gaussian 09<sup>19-21</sup> with use of the functional and the basis set described above. For each candidate, a sufficient number of excited states were calculated so that spectral simulation covers the wavelength range down to around 200 nm. The calculated transitions were replaced by a Gaussian broadening function with a full width at half maximum height of 0.2 eV to simulate the electronic transition spectrum. Molecular orbital pictures were generated using GaussView 5.0.<sup>22</sup>

The choice of basis set (6-31G\*\*) was confirmed to be valid within the scope of our study by testing the results computed using a larger basis set. For instance, the M06/6-311+G(2d,p)/PCM level of calculations afford optimized geometry consistent with that computed at the M06/6-31G\*\*/PCM level (Fig. S19). Moreover, the spectral features simulated using the TD-DFT results given by these two different calculation levels are essentially same (Figs. S20a-c). Consequently, the 6-31G\*\* basis set was adopted in all calculations in order to minimize the computational time and cost available.

**Monte Carlo Simulation of CS Lifetimes.** The simulation program has been coded in Pascal using Delphi ver. 5.0 and is available for any purposes at the authors' website:

[http:// www.sec.kyushu-u.ac.jp/Sakutai/software//cs\\_lifetime\\_vs\\_migration.zip](http://www.sec.kyushu-u.ac.jp/Sakutai/software//cs_lifetime_vs_migration.zip)

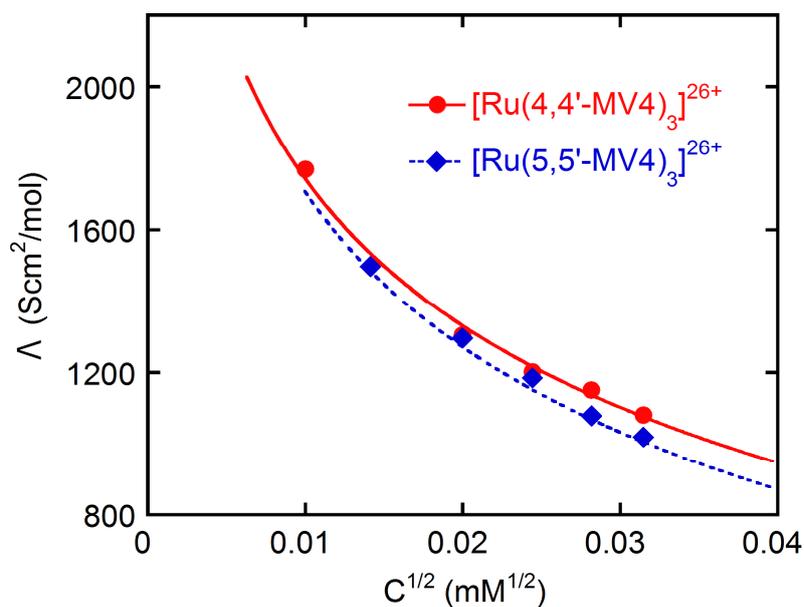

This program supposes that several equivalent branches involving a few equivalent viologen acceptor sites are tethered to a single  $Ru(bpy)_3^{2+}$ -type photosensitizer, as depicted in Fig. 4a. The test case defined in Fig. 4a supposes that one branch has interaction with two equivalent branches. Even after conducting an inter-branch ET event, an exactly same situation is supposed to be recovered. Therefore, three branches, in this case, should be positioned in a trigonal

fashion. Our model also supposes that locations of two  $MV^{2+}/MV^+$  sites within a branch are rapidly exchanged or moving around so that inter-branch ET toward every adjacent branch can take place with an equal probability. Under such conditions, ET events can be classified into three types, intra-branch ET, inter-branch ET, and BET, as illustrated in the above picture. Our model supposes that probabilities of conducting these three ET events are different. Here the frequency factors for intra-branch ET, inter-branch ET, and BET are defined by  $(n\_intra) \times (intra\_ff)$ ,  $(n\_inter) \times (inter\_ff)$ , and 1, respectively, where  $n\_intra$  defines the number of adjacent viologen units within the branch which has already accepted one electron from the photoexcited pigment, and  $n\_inter$  is the number of equivalent adjacent branches available for ET, while  $intra\_ff$  and  $inter\_ff$  are used to further tune the probabilities of intra-branch and inter-branch ET processes, respectively. Note that the frequency factor of BET is not defined as a variable parameter and is fixed as unity in this model. In the model depicted above,  $n\_intra$  and  $n\_inter$  must be specified as 1 and 2, respectively. In the experiments in Fig. 4b,  $intra\_ff = 4$  and  $inter\_ff = 10$  are adopted as roughly optimized values to reproduce the experimentally observed CS decay profiles. When the CS decay profile of  $[Ru(x,x'-MV4)_3]^{26+}$  is examined, an appropriate model can be defined by supposing  $n\_intra = 1$ ,  $n\_inter = 4$ ,  $intra\_ff = 4$ , and  $inter\_ff = 10$ , by which the probabilities of conducting intra-branch ET, inter-branch ET, and BET are given as  $(n\_intra \times intra\_ff) / \{(n\_intra \times intra\_ff) + (n\_inter \times inter\_ff) + 1\} = 4/45$ ,  $(n\_inter \times inter\_ff) / \{(n\_intra \times intra\_ff) + (n\_inter \times inter\_ff) + 1\} = 40/45$ , and  $1/45$ , respectively. In these experiments, three additional parameters are defined. One is a permeation coefficient ( $\kappa_{BET}$ ) when conducting BET and is defined as  $\kappa_{BET} = 1/3$ . On the other hand, the permeation coefficient ( $\kappa_{EM}$ ) for conducting all the remaining ET events leading to EM is also defined as unity ( $\kappa_{EM} = 1$  for intra\_branch and inter\_branch ET events). These specify that the probability of having a BET event is  $(1/45) \times (1/3) = 1/135$  in each step, while that of having a migration event is  $44/45$ . A set of parameters defined with  $n\_intra = 1$ ,  $n\_inter = 0$ ,  $intra\_ff = 4$ , and  $inter\_ff = 10$  is appropriate to examine the behavior of  $[Ru(bpy)_2(5,5'-MV4)]^{10+}$  since the inter-branch ET among the 5,5'-positioned branches can be ruled out. The last parameter is the time spent to complete each ET step ( $t_{div}$ ). This include the time spent for diffusion, and is postulated as  $t_{div} = 6$  ns in these test cases. In summary, by using the values listed below, the lifetimes of a hundred thousand of CS states were generated by the Monte Carlo technique. As a result, the computed results somehow reflect the observed tendency, which strengthens the validity of such statistical approach in predicting electron migration within a multi-acceptor system.

**Parameters employed for the calculations given Fig. 4b:**

$n_{\text{intra}} = 1$	no. of other $MV^{2+}$ units within the branch accepted one electron
$n_{\text{inter}} = 0, 1, 2, 3, 4$	no. of adjacent branches available for ET
$\text{intra\_ff} = 4^{***}$	frequency factor to conduct intra-branch ET
$\text{inter\_ff} = 10$	frequency factor to conduct inter-branch ET
$\kappa_{\text{BET}} = 1/3$	permeation coefficient for conducting BET
$\kappa_{\text{EM}} = 1$	permeation coefficient for conducting self exchange among $MV^+$ and $MV^{2+}$
$t_{\text{div}} = 6 \text{ ns}$	time spent for completing each step

\*\*\* The lower  $\text{intra\_ff}$  value relative to  $\text{inter\_ff}$  may be due to the fact that stronger association of a  $\text{PF}_6^-$  anion within each branch makes the intra-branch ET more difficult to proceed in compared with the inter-branch ET process.

**Figure S1.** The observed and calculated molar conductivity vs. the square root of the total PCS concentration ( $C_t$ ), measured for  $[\text{Ru}(4,4'\text{-MV4})_3](\text{PF}_6)_{26}$  and  $[\text{Ru}(5,5'\text{-MV4})_3](\text{PF}_6)_{26}$ . The solid and dashed lines show the fitting based on our published methods.<sup>2</sup>

**Table S1.** The observed molar conductivity of PCSs in water vs. the square root of the total concentration ( $C_t$ ), measured in air at 20 °C.

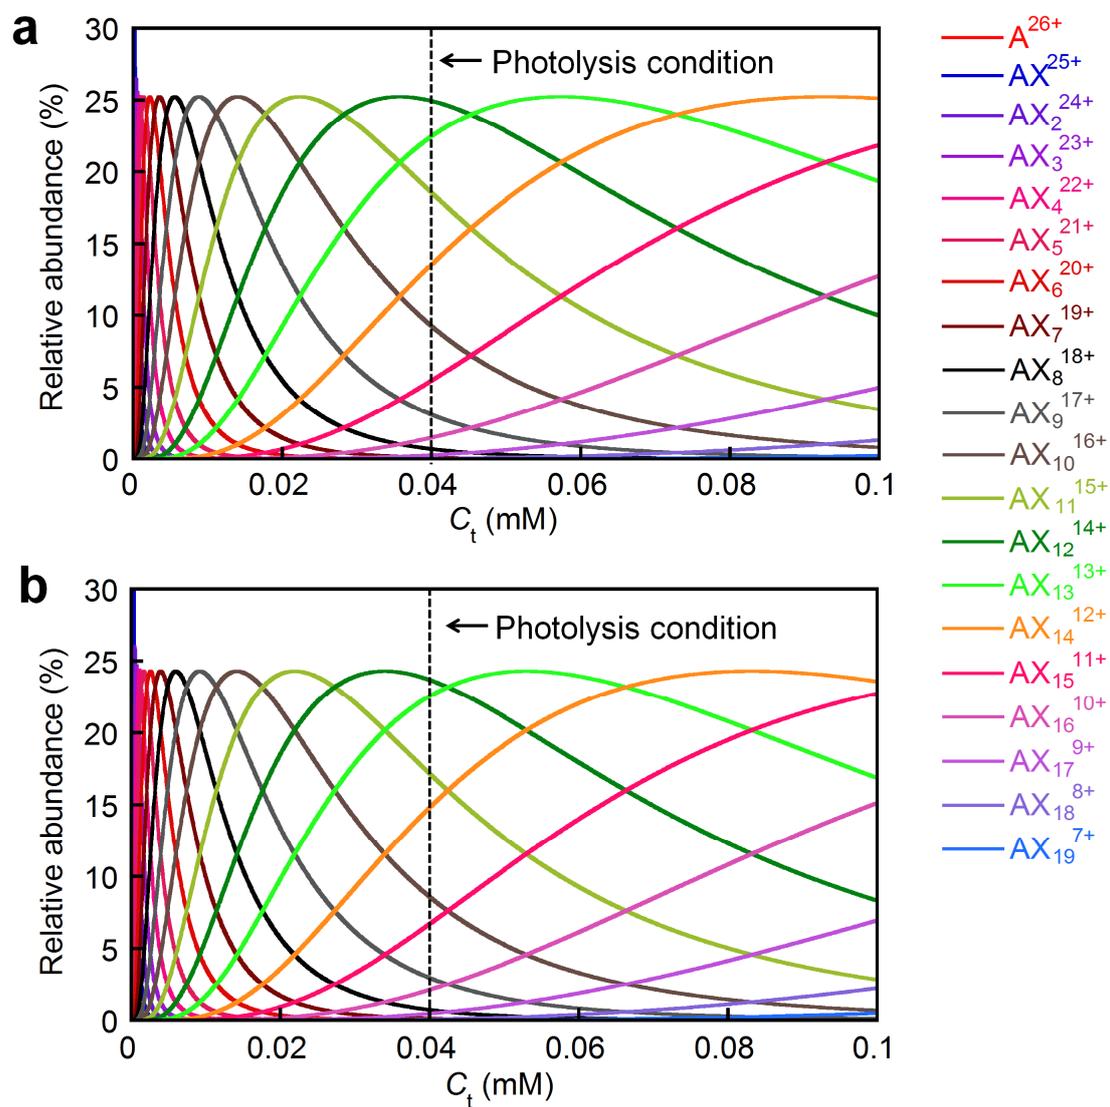

Complex	$C_t^{1/2}$ ( $\text{mM}^{1/2}$ )	$\Lambda$ ( $\text{S cm}^2 \text{ mol}^{-1}$ )

**Figure S2.** Relative abundances of the  $AX_m^{(z-m)+}$  species ( $X = \text{PF}_6^-$ ,  $m = 1, 2, 3, \dots$ ) vs.  $C_t$  are calculated for (a)  $[\text{Ru}(4,4'\text{-MV4})_3](\text{PF}_6)_{26}$  and (b)  $[\text{Ru}(5,5'\text{-MV4})_3](\text{PF}_6)_{26}$  using the parameters determined for Fig. S1 (see Table S3 for details).

**Figure S3.** The space-filling model computed for one of the ion-pair adducts,  $\{[\text{Ru}(\text{5,5}'\text{-MV4})_3](\text{PF}_6)_{12}\}^{14+}$  (computed by MM3).

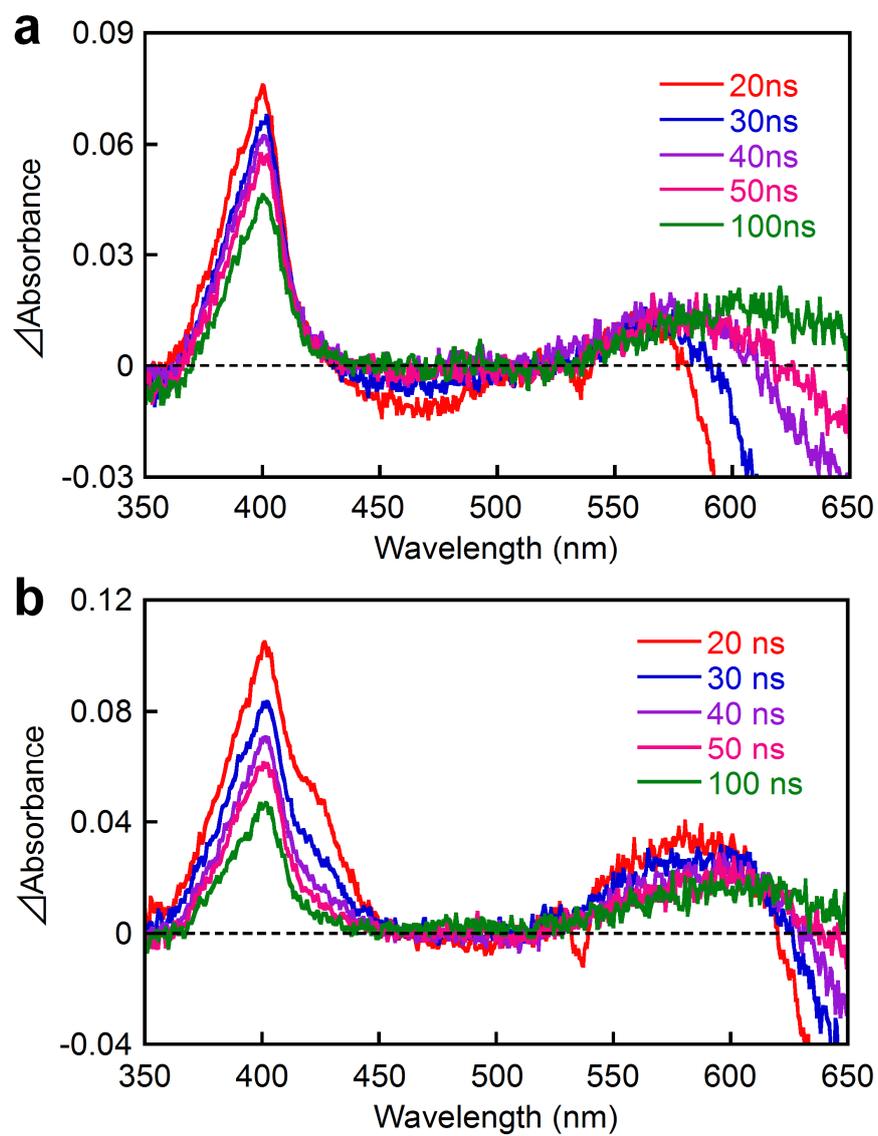

**Figure S4.** (a) Absorption spectra recorded for an aqueous solution of each complex at 20 °C in air. The inset shows the magnification of the  $^1\text{MLCT}$  bands. (b) Emission spectra recorded for an aqueous solution of each complex under Ar atmosphere at 20 °C. The excitation wavelength was 470 nm and both solutions had an equal absorbance at 470 nm (0.05). The red and blue lines correspond to the spectral data observed for  $[\text{Ru}(\mathbf{4,4'}\text{-MV4})_3](\text{PF}_6)_{26}$  and  $[\text{Ru}(\mathbf{5,5'}\text{-MV4})_3](\text{PF}_6)_{26}$ , respectively.

**Table S4.** Absorption and emission properties of PCSs together with those of [Ru(bpy)<sub>3</sub>]Cl<sub>2</sub>·6H<sub>2</sub>O.

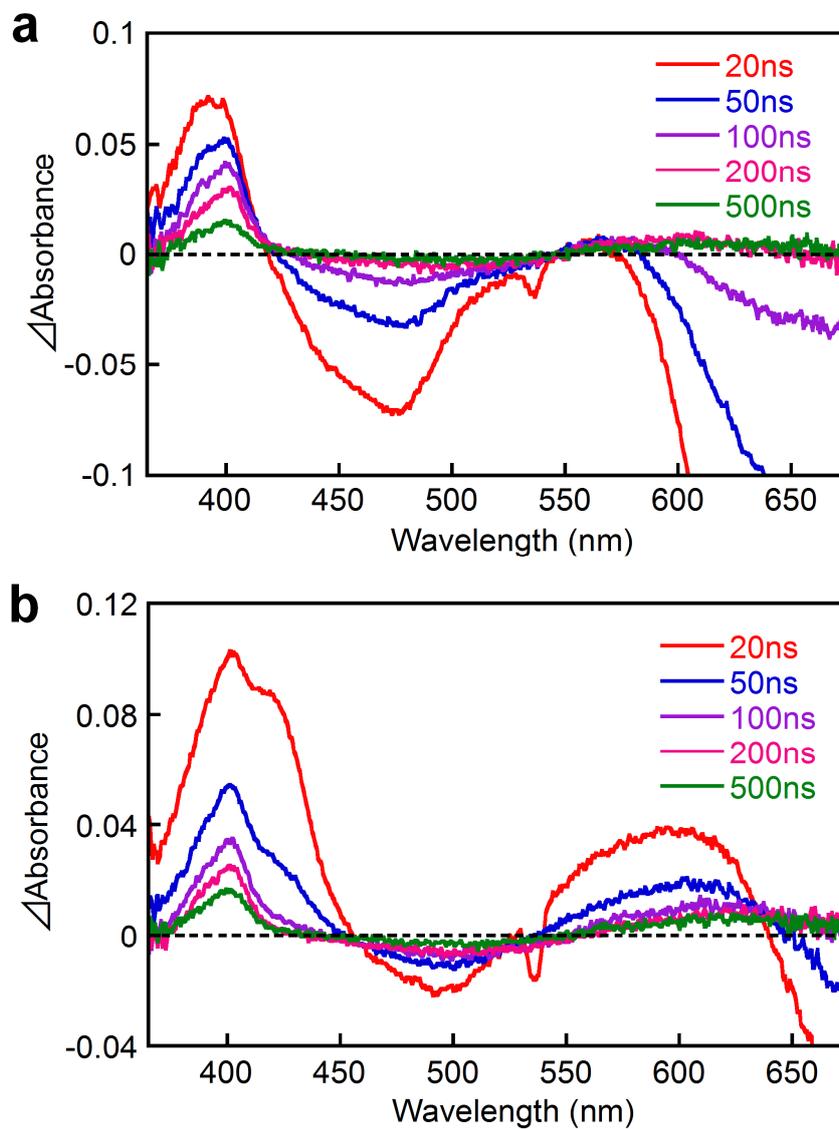

Complex	$\lambda_{\text{abs}}$ (nm)	$\epsilon$ (M <sup>-1</sup> cm <sup>-1</sup> )	$\lambda_{\text{em}}$ (nm)	$\Phi_{\text{em}}^a$
[Ru( <b>4,4'</b> -MV4) <sub>3</sub> ](PF <sub>6</sub> ) <sub>26</sub>	468	27 100	633	0.002
	257	248 600		
[Ru( <b>5,5'</b> -MV4) <sub>3</sub> ](PF <sub>6</sub> ) <sub>26</sub>	490	11 000	670	0.001
	259	242 300		
[Ru(bpy) <sub>3</sub> ]Cl <sub>2</sub> ·6H <sub>2</sub> O <sup>b</sup>	452	14 000	628	0.042
	286	81 400		

<sup>a</sup>Emission quantum yields were determined using an absolute photoluminescence quantum yield measurement system equipped with an integrating sphere, as described in Experimental Section.

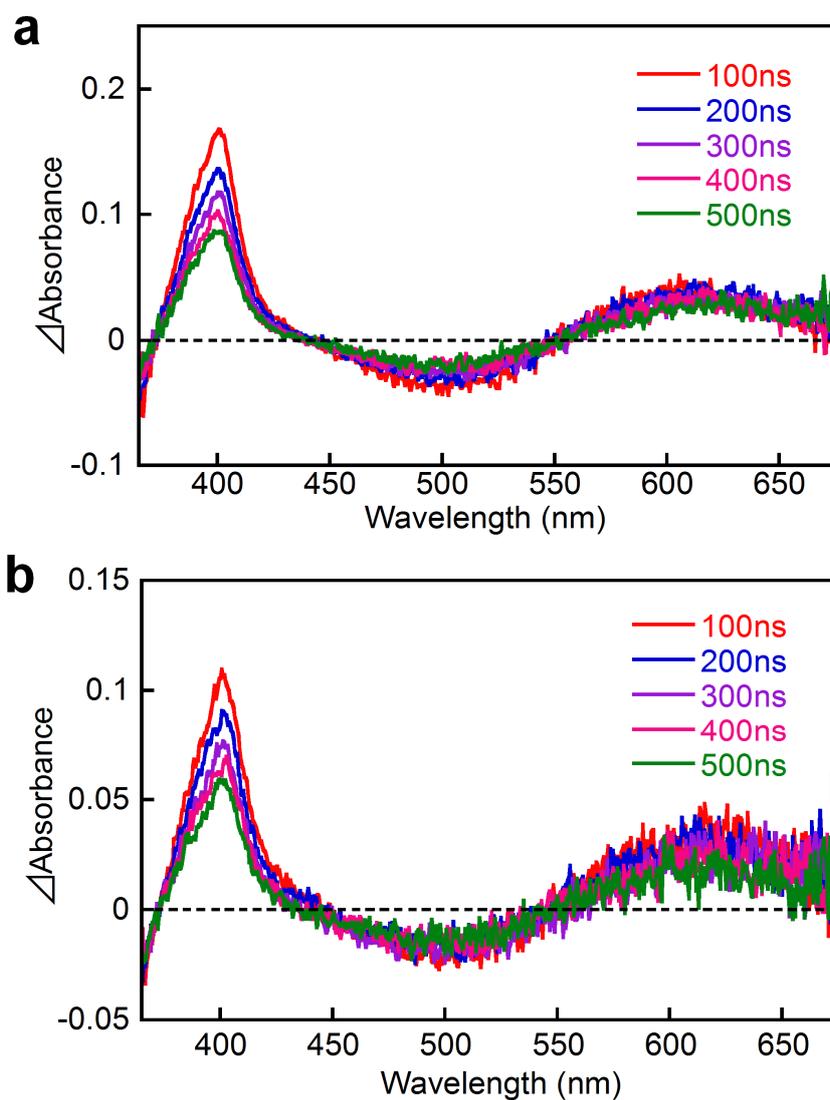

<sup>b</sup>Values taken from ref. 23.

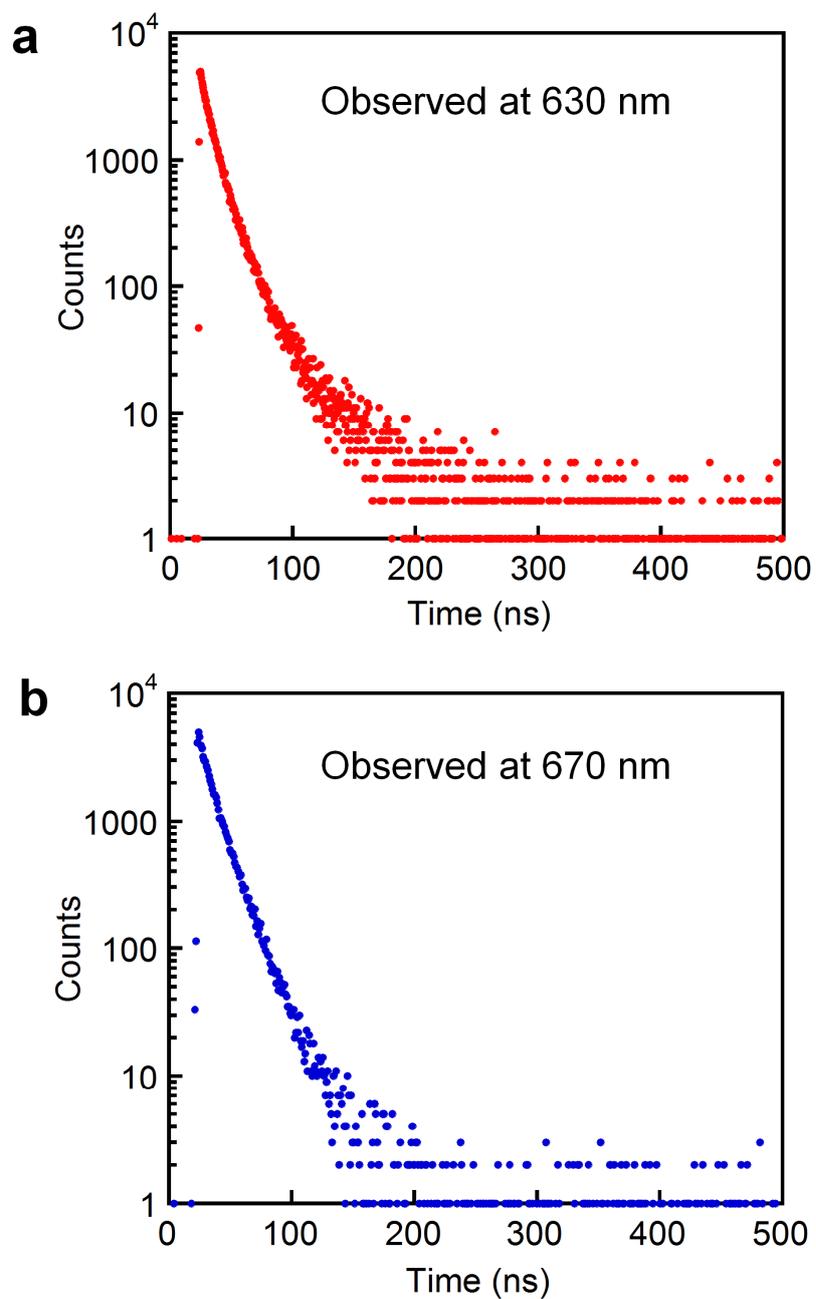

**Figure S5.** Transient absorption spectral changes observed after laser pulse excitation at 532 nm for an aqueous solution of (a)  $[\text{Ru}(4,4'\text{-MV4})_3](\text{PF}_6)_{26}$  and (b)  $[\text{Ru}(5,5'\text{-MV4})_3](\text{PF}_6)_{26}$  in the absence of EDTA under Ar atmosphere at room temperature.

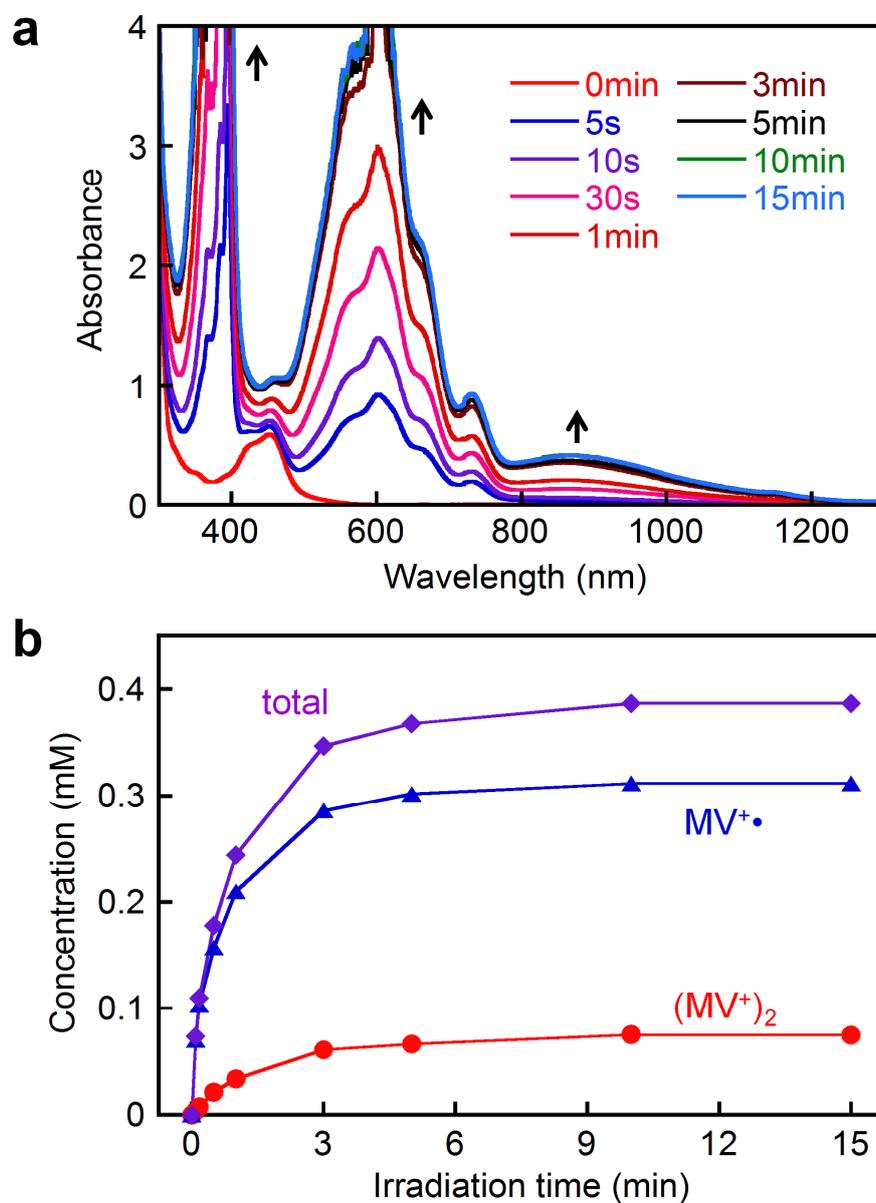

**Figure S6.** Transient absorption spectral changes observed after laser pulse excitation at 532 nm for an aqueous acetate buffer solution (0.1 M, pH 5.0) of (a)  $[\text{Ru}(4,4'\text{-MV4})_3](\text{PF}_6)_{26}$  and (b)  $[\text{Ru}(5,5'\text{-MV4})_3](\text{PF}_6)_{26}$  in the absence of EDTA under Ar atmosphere at room temperature.

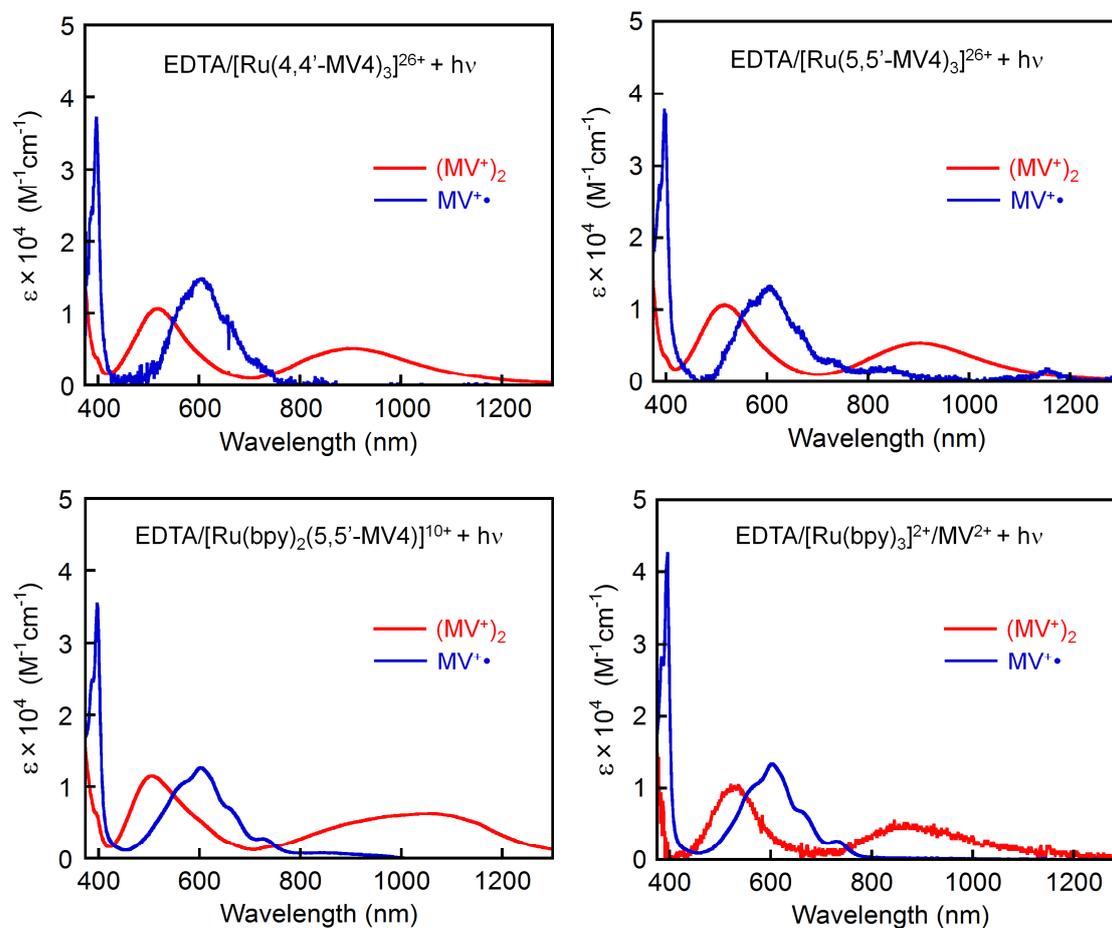

**Figure S7.** Transient absorption spectral changes observed after laser pulse excitation at 532 nm for an aqueous acetate buffer solution (0.1 M, pH 5.0) of (a)  $[\text{Ru}(\mathbf{4,4}'\text{-MV4})_3](\text{PF}_6)_{26}$  and (b)  $[\text{Ru}(\mathbf{5,5}'\text{-MV4})_3](\text{PF}_6)_{26}$  in the presence of EDTA (30 mM) under Ar atmosphere at room temperature. The emission bleach seen above 600 nm in Figs. S5,S6 are not observable here, revealing that the triplet component has a minor contribution under these conditions.

**Figure S8.** Emission decays after laser pulse excitation at 472 nm, observed for an aqueous solution of (a)  $[\text{Ru}(\mathbf{4,4}'\text{-MV4})_3](\text{PF}_6)_{26}$  and (b)  $[\text{Ru}(\mathbf{5,5}'\text{-MV4})_3](\text{PF}_6)_{26}$  under Ar atmosphere at 20 °C.

**Figure S9.** (a) Spectral changes during photolysis of an aqueous acetate buffer solution (0.1 M, pH = 5.0) containing 0.04 mM  $[Ru(bpy)_3](NO_3)_2$ , 2 mM  $MV(NO_3)_2$ , and 30 mM EDTA under Ar atmosphere at 20 °C. (b) The total concentration of  $MV^{\bullet+}$  together with those divided into  $MV^{\bullet+}$  and  $(MV^+)_2$  components as a function of time.

**Figure S10.** Two spectral components extracted in spectral deconvolution analysis. In each case, all spectra observed during multi-charge storage can be expressed as the sum of two spectral components arising from  $MV^{\bullet+}$  and  $(MV^+)_2$ , with a definition of  $Abs(w, t) = C_m(t)\epsilon_m(w) + C_d(t)\epsilon_d(w)$ , where  $Abs$  is absorbance,  $C_m$  and  $C_d$  are molar concentrations of  $MV^{\bullet+}$  and  $(MV^+)_2$ , respectively,  $\epsilon_m$  and  $\epsilon_d$  are molar absorptivities of  $MV^{\bullet+}$  and  $(MV^+)_2$ , respectively,  $t$  is time, and  $w$  is wavelength. The original scans are those given in Figs. 5a-c and S9a.

**Table S5.** Absorption maxima and molar absorptivities for the MV<sup>+</sup>• and (MV<sup>+</sup>)<sub>2</sub> sites generated in each system. The values are determined from the spectra shown in Fig. S10, which were obtained by spectral deconvolution in Figs. S11–14.

The raw data were taken from those in Fig. S9a, where the spectral component derived from the unphotolyzed charge separator was removed by subtraction. Each spectrum was fitted to the sum of two spectral components shown in Fig. S10d, the concentrations of  $\text{MV}^{\bullet+}$  and  $(\text{MV}^+)_2$  were determined by the least-squares method implemented in our program.<sup>24</sup>

**Figure S14 (Continued).**

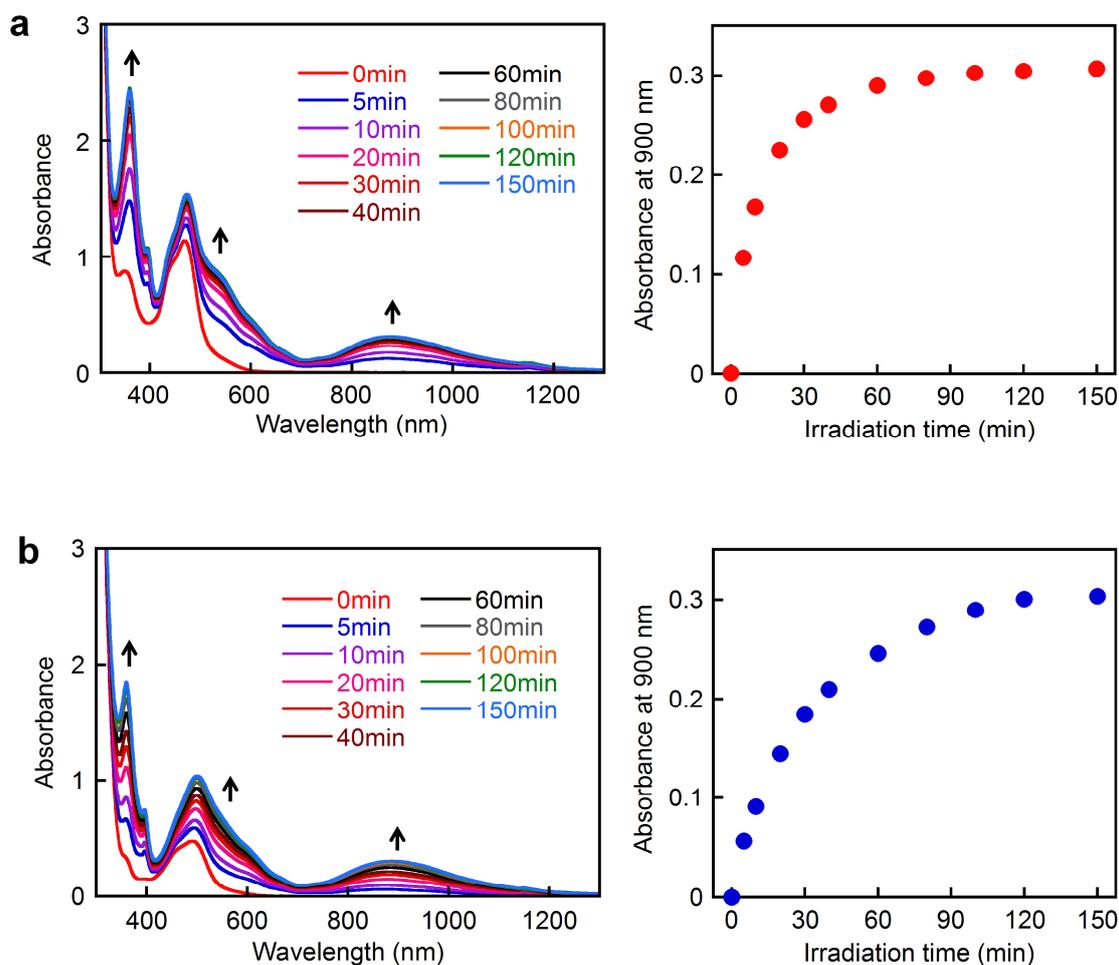

**Figure S15.** Molar absorptivities of 12-electron reduced species generated by adding  $\text{Na}_2\text{S}_2\text{O}_4$ . For each case, spectra before (—) and after (---) adding an excess of  $\text{Na}_2\text{S}_2\text{O}_4$  (ca. 0.4 mg, 2.30  $\mu\text{mol}$ ) were observed for a 0.04 mM solution of each complex in an aqueous 0.1 M acetate buffer solution (pH = 5.0) under Ar atmosphere at 20 °C. Measurements were carried out using a quartz cell having a path length of 5 mm.

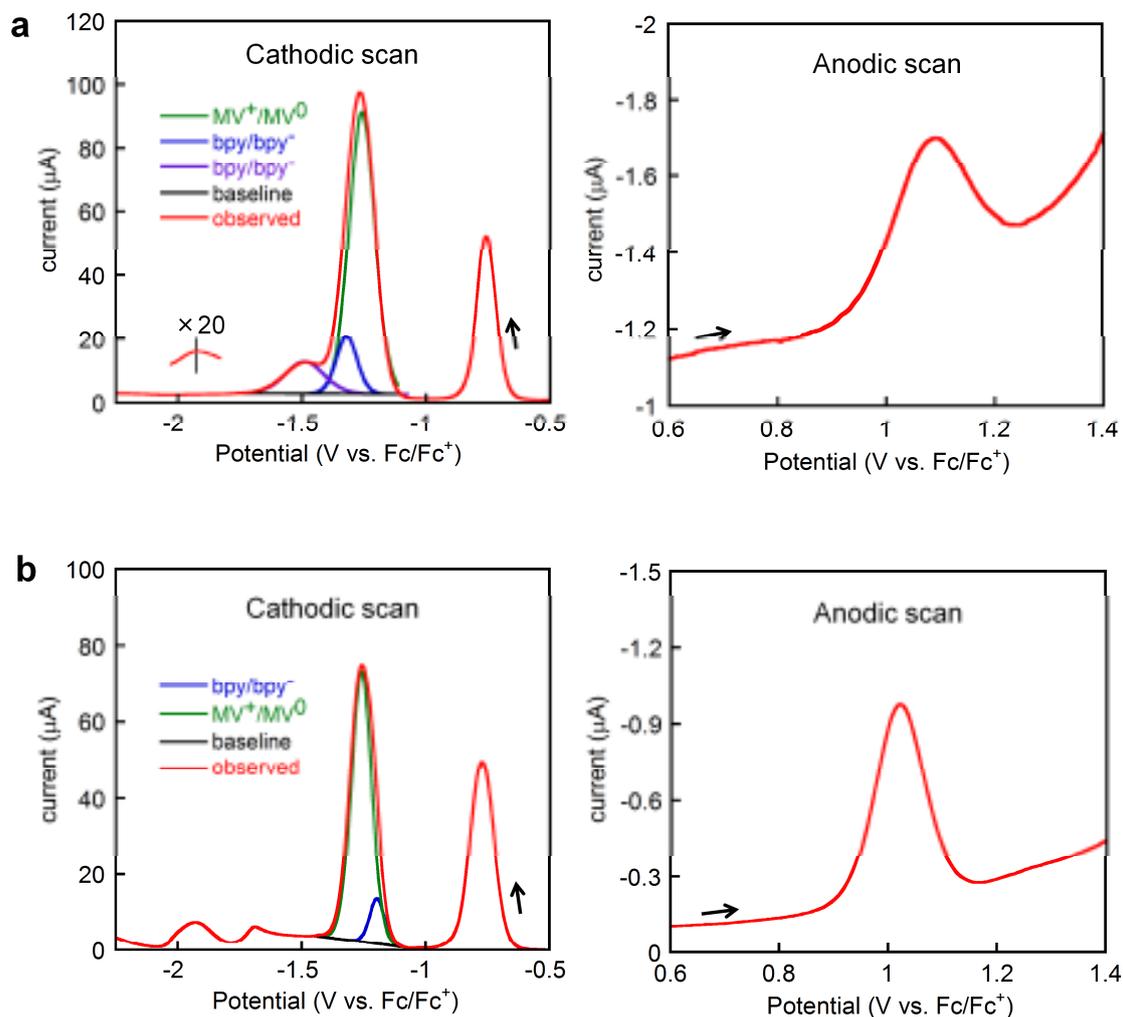

**Table S10.** The number of electrons stored over the PCSs at the saturation stage, determined by using the molar absorptivities of 12-electron-reduced species generated by adding a large excess of Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub> (see Fig. S15).

Reduction Method	[Ru(4,4'-MV4) <sub>3</sub> ] <sup>26+</sup>		[Ru(5,5'-MV4) <sub>3</sub> ] <sup>26+</sup>	
	Photochemically (60-min irradiation)	Thermally	Photochemically (60-min irradiation)	Thermally
Reductant	EDTA	Na <sub>2</sub> S <sub>2</sub> O <sub>4</sub>	EDTA	Na <sub>2</sub> S <sub>2</sub> O <sub>4</sub>
ΔAbs at 530 nm	2.660	1.930 <sup>a</sup>	2.510	1.850 <sup>a</sup>
ΔAbs at 900 nm	1.290	0.948 <sup>a</sup>	1.310	0.959 <sup>a</sup>
Number of electron stored (molecule <sup>-1</sup> ) (calcd. from ΔAbs at 530 nm)	8.27	12	8.14	12
Number of electron stored (molecule <sup>-1</sup> ) (calcd. from ΔAbs at 900 nm)	8.16	12	8.20	12
Number of electron stored (molecule <sup>-1</sup> ) (average)	<b>8.2</b>	--	<b>8.2</b>	--

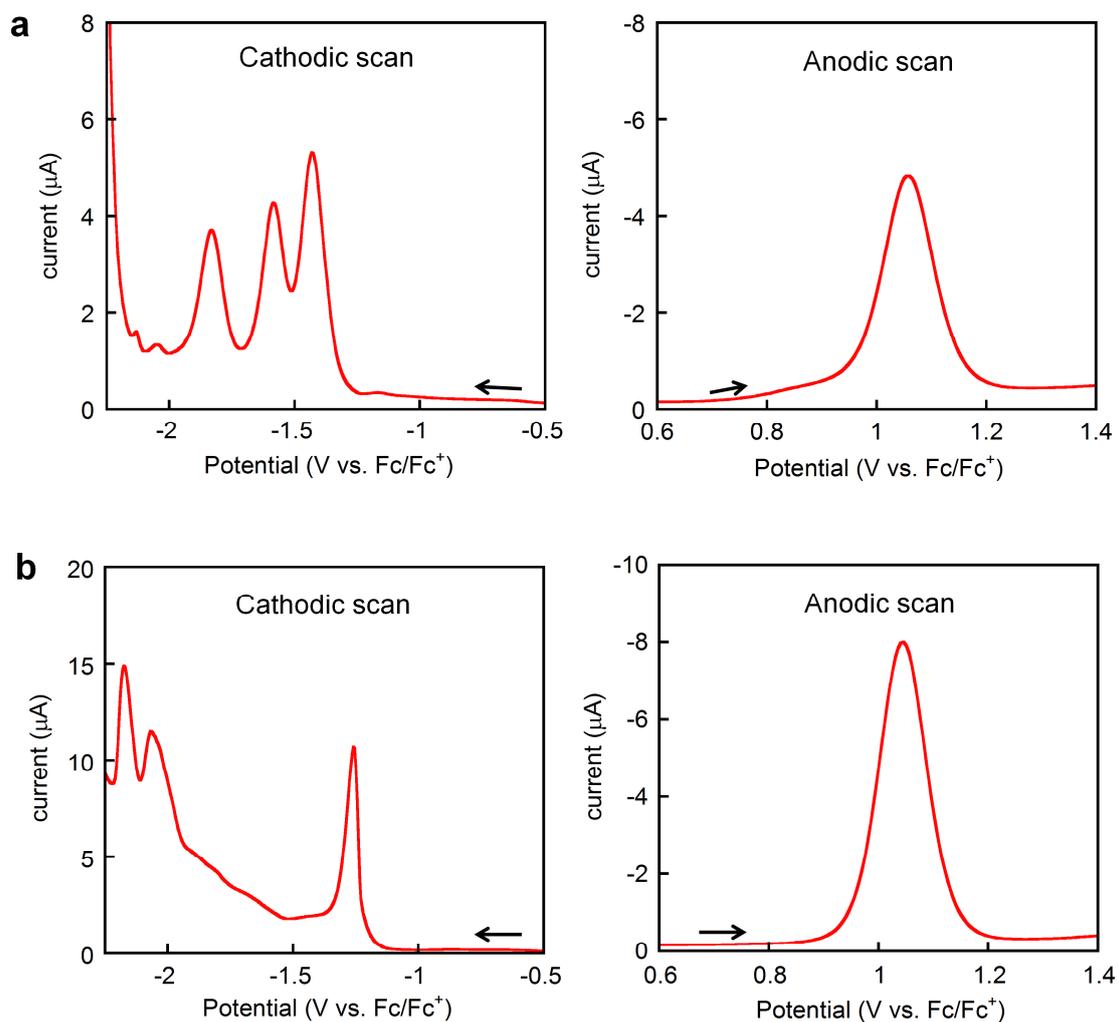

<sup>a</sup>Measurements were carried out using a quartz cell having an optical path length of 5 mm.

**Figure S16.** Reduced charge storage efficiency with a neutral donor. Spectral changes during photolysis of an aqueous solution (pH = 7.0) containing 30 mM triethanolamine (TEOA) in the presence of each PCS (0.04 mM) under Ar atmosphere at 20 °C, where the pH was adjusted with HCl. The results in **a** and **b** were given for  $[\text{Ru}(\mathbf{4,4}'\text{-MV4})_3](\text{PF}_6)_{26}$  and  $[\text{Ru}(\mathbf{5,5}'\text{-MV4})_3](\text{PF}_6)_{26}$ , respectively. The number of electrons stored at saturation was estimated to be 1.9 for  $[\text{Ru}(\mathbf{4,4}'\text{-MV4})_3](\text{PF}_6)_{26}$  and 1.7 for  $[\text{Ru}(\mathbf{5,5}'\text{-MV4})_3](\text{PF}_6)_{26}$  using the absorption coefficient per viologen unit at 548 nm where an isosbestic point is given for the monomer-dimer equilibrium, i.e.,  $\epsilon_{548}(\text{MV}^+\bullet) = \frac{1}{2}\epsilon_{548}((\text{MV}^+)_2) = 8920 \text{ M}^{-1}\text{cm}^{-1}$ , which was reported in the literature.<sup>25</sup>

**Figure S17.** Oxidation and reduction waves for (a)  $[\text{Ru}(4,4'\text{-MV4})_3](\text{PF}_6)_{26}$  and (b)  $[\text{Ru}(5,5'\text{-MV4})_3](\text{PF}_6)_{26}$ , observed using square wave voltammetry. Measurements were carried out for a 1 mM solution of each complex in acetonitrile containing 0.1 M tetra(n-butyl)ammonium hexafluorophosphate (TBAH) at room temperature under Ar. The validity of these deconvolution treatments was confirmed by observing the  $\text{bpy}/\text{bpy}^{\bullet-}$  redox couples of the controls free of viologen tethers  $[\text{Ru}(4,4'\text{-ME2})_3](\text{PF}_6)_2$  and  $[\text{Ru}(5,5'\text{-ME2})_3](\text{PF}_6)_2$ .

**Figure S18.** Oxidation and reduction waves for (a)  $[\text{Ru}(4,4'\text{-ME}_2)_3](\text{PF}_6)_2$  and (b)  $[\text{Ru}(5,5'\text{-ME}_2)_3](\text{PF}_6)_2$ , observed using square wave voltammetry. Measurements were carried out for a 1 mM solution of each complex in acetonitrile containing 0.1 M tetra(n-butyl)ammonium hexafluorophosphate (TBAH) at room temperature under Ar.

**Table S11.** Redox potentials for the PCSs together with the corresponding controls. Measurements were carried out for a solution of each complex (1 mM) in an acetonitrile solution containing 0.1 M tetra(n-butyl)ammonium hexafluorophosphate (TBAH) at room temperature under Ar atmosphere. Potentials are given in volts vs. Fc/Fc<sup>+</sup>.

<sup>a</sup>ZPE = zero point energy given in frequency calculations. All the structures, except for those with notification b, converged with structures satisfying the initial type of stacking manner.

<sup>b</sup>The geometry optimization of these three systems rather converged with the structures converted into slipped geometries. Several attempts to preserve the initial eclipsed structures failed with some of them converted into staggered geometries.

**Table S13.** Geometry optimized for the eclipsed  $\pi$ -dimer of non-derivatized MV<sup>+</sup>, i.e., (MV<sup>+</sup>)<sub>2</sub>, in its closed-shell singlet state (stereo view shown below). Optimized at the M06/6-31G\*\* level under water solvated model (PCM, polarizable continuum model).<sup>a</sup>

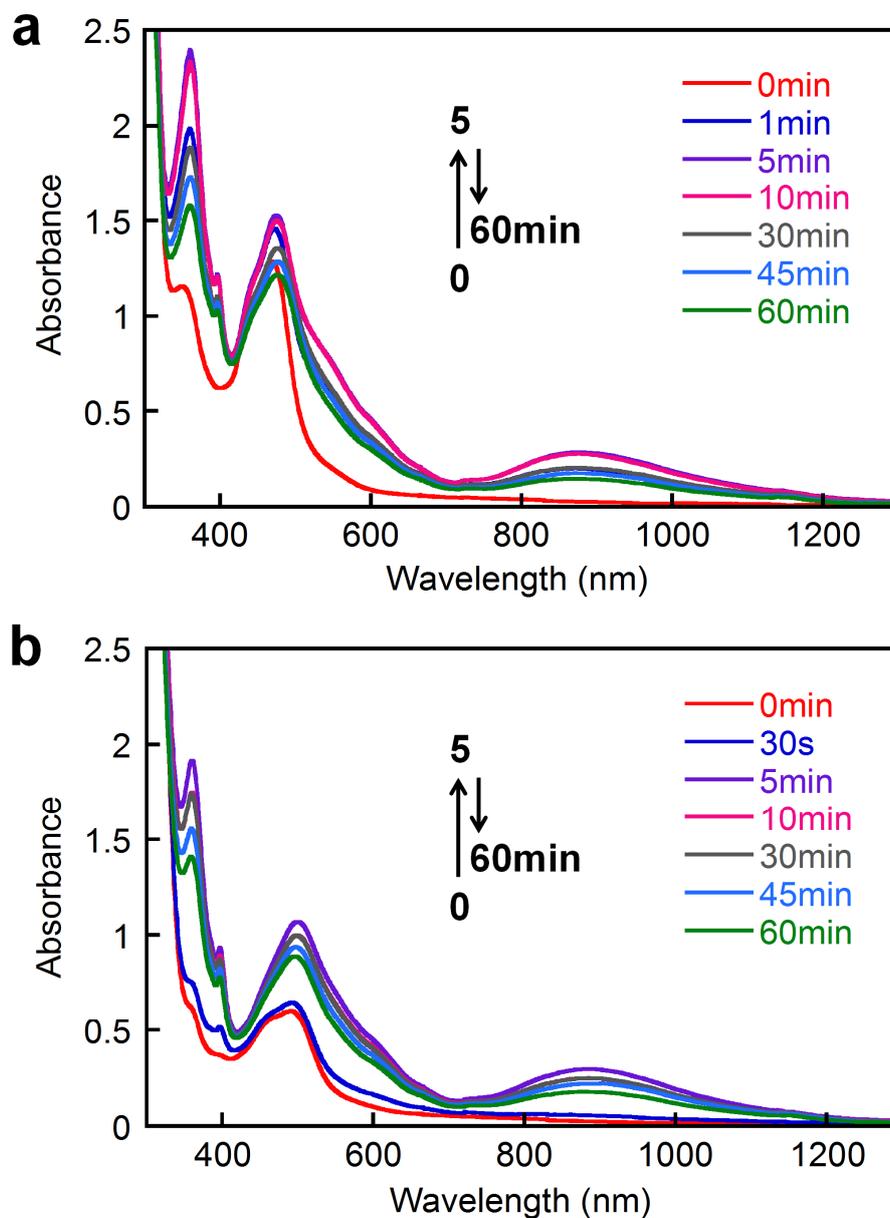

**Figure S19.** Geometries of non-derivatized  $(MV^+)_2$  (closed-shell singlet) optimized using the M06/6-31G\*\*/PCM and M06/6-311+G(2d,p)/PCM level of DFT are superimposed in a stereo mode.

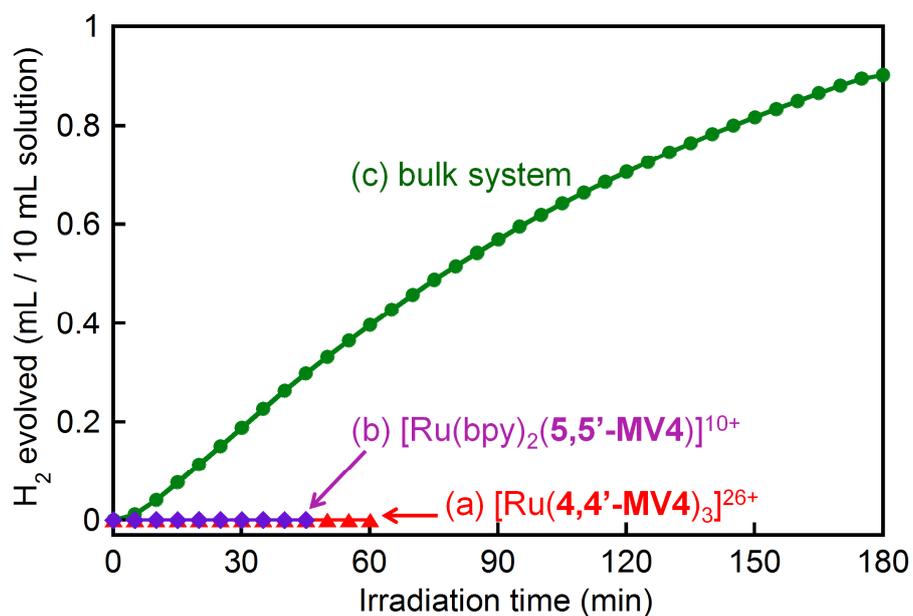

**Figure S20.** Calculated absorption spectra of the staggered  $\pi$ -dimers of non-derivatized  $MV^+$ , i.e.,  $(MV^+)_2$ , in its closed-shell singlet state, optimized using (a) M06/6-31G\*\* or (b) M06/6-311+G(2d,p) level under water solvated model (PCM, polarizable continuum model). (c) Comparison of calculated absorption spectra.

**Figure S21.** Linear relationship between the rate of H<sub>2</sub> evolution shown in Fig. 9A and the rate of electron charging shown in Fig. 5.

**Figure S22.** Spectral changes during the photolysis of an aqueous acetate buffer solution (0.03 M  $\text{CH}_3\text{COOH}$ , 0.07 M  $\text{CH}_3\text{COONa}$ ; pH = 5.0) containing 30 mM EDTA and PVP-protected colloidal Pt (0.1 mM on the basis of the net Pt atom concentration) in the presence of (a) 0.04 mM  $[\text{Ru}(4,4'\text{-MV}_4)_3](\text{PF}_6)_{26}$  and (b) 0.04 mM  $[\text{Ru}(5,5'\text{-MV}_4)_3](\text{PF}_6)_{26}$  at 20 °C under Ar atmosphere.

**Figure S23.** Photochemical H<sub>2</sub> evolution from an aqueous acetate buffer solution (0.1 M, pH = 5.0) containing TEOA (30 mM) and PVP-protected colloidal Pt (0.1 mM on the basis of the net Pt atom concentration) in the presence of (a) 0.04 mM [Ru(4,4'-MV4)<sub>3</sub>](PF<sub>6</sub>)<sub>26</sub>, (b) 0.04 mM [Ru(bpy)<sub>2</sub>(5,5'-MV4)](PF<sub>6</sub>)<sub>10</sub>, or (c) 0.04 mM [Ru(bpy)<sub>3</sub>](NO<sub>3</sub>)<sub>2</sub> and 2 mM MV(NO<sub>3</sub>)<sub>2</sub>, under Ar atmosphere at 20 °C under visible light irradiation (300 W Xe; λ > 400 nm).
