## Experimental Section

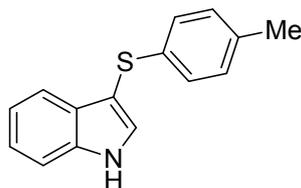

### General methods:

All reactions were conducted under open air atmosphere. Apparatus used for reactions are perfect oven dried. 1,4-Dioxane and other solvents were used as received. The  $^1\text{H}$  NMR spectra were recorded at 300 & 500 MHz, and  $^{13}\text{C}$  NMR 75 & 125 MHz in  $\text{CDCl}_3$ ,  $J$  values were recorded in hertz and abbreviations used were *s*-singlet, *d*-doublet, *t*-triplet, *m*-multiplet, br-broad, *dd*-doublet of doublet. Chemical shifts ( $\delta$ ) are reported relative to TMS ( $\delta = 0.0$ ) as an internal standard. IR (FT-IR) spectra were measured as KBr pellet or as film. Mass spectral data were compiled using MS (ESI), HRMS mass spectrometers. Column chromatography was carried out using Silica gel 100-200 mesh (commercial suppliers).

### The typical procedure for synthesis of 3-(*p*-Tolylthio)-1H-indole (**3a**):

To a stirred solution of indole **1a** (2 mmol) in 1,4-dioxane (3 mL) was added sulfonylchloride, **2a** (1.0 mmol) and CuI (10 mol%) successively. The resulting reaction mixture was heated at the 80 °C for 4h, in open air. Subsequently, the reaction mixture was allowed to reach ambient temperature, and the solvent was evaporated to result a residue which was purified by silica gel chromatography, eluting with hexane / ethyl acetate (10 : 0.5 to 10 : 1) furnished the thioindole, **3a** at an 86% yield.
