Table of Contents:

1. ¹ H NMR of Compound (2)	S3
2. ESI LCMS [M+1] ⁺ spectrum of Compound (2)	S4
3. ¹ H NMR of Compound (BPB)	S4
4. Expansion spectrum of ¹ H NMR of Compound (BPB)	S5
5. TOF MS ES ⁺ mass spectrum of Compound (BPB)	S6
6. ¹³ C NMR spectrum of Compound (BPB)	S7
7. Effects of water composition on the fluorescence of (a) BPB , (b) BPB in the presence of hydrazine, and (c) their plot in aqueous DMSO	S8
8. ESI LCMS spectra of BPB + N ₂ H ₄	S9
9. Calculations for detection limit	S9
10. Calibration curve for fluorescence titration of BPB with hydrazine	S9
11. Competition Fluorescence experiments for a BPB -hydrazine system in the presence of coexisting (a) amines/anions and (b) cations	S10
12. UV-vis and fluorescence spectral change of compound (2) with hydrazine	S11
13. UV-vis and fluorescence spectral change of γ -oxo-1-pyrenebutyric acid with hydrazine	S11
14. Influences of pH on the emission spectra of BPB	S12
15. Computational Study	S12-S17

Figure S1. ¹H NMR of **Compound (2)** (d₆-DMSO, 400 MHz).

Figure S2. ESI LCMS $[M+1]^+$ spectrum of **Compound (2)**.

Figure S3. ^1H NMR of **Compound (BPB)** (d_6 -DMSO, 400 MHz).

Figure S4. Expansion spectrum of ¹H NMR of **Compound (BPB)** (d₆-DMSO, 400 MHz).

Figure S5. TOF MS ES+ mass spectrum of Compound (BPB).

Figure S6. ¹³C NMR spectrum of **Compound (BPB)** (d₆-DMSO, 100 MHz).

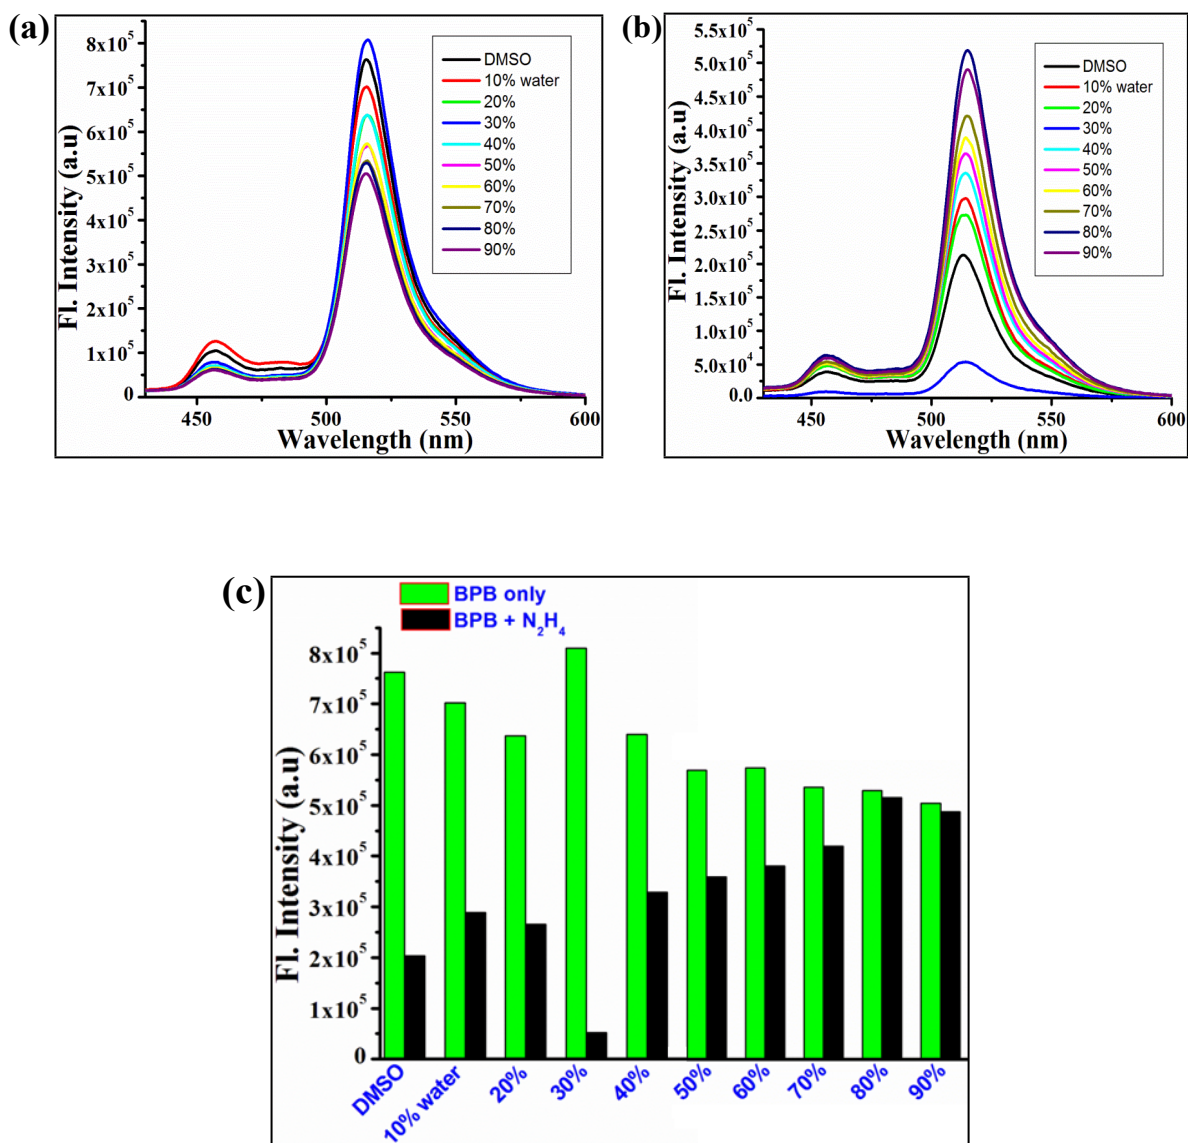

Figure S7. Effects of water composition on the fluorescence of (a) **BPB**, (b) **BPB** in the presence of hydrazine, and (c) their plot in aqueous DMSO.

Figure S8. ESI LCMS spectra of **BPB**+ N_2H_4 .

Calculations for detection limit

The detection limit (DL) of **BPB** for hydrazine was determined from the following equation:

$$DL = K * Sb1/S$$

Where K = 2 or 3 (we take 2 in this case); Sb1 is the standard deviation of the blank solution; S is the slope of the calibration curve.

Figure S9. Calibration curve for fluorescence titration of **BPB** with hydrazine.

From the graph we get slope (S) = 7×10^{10} . Standard deviation (Sb1=65536.8123)

Thus using the formula we get the detection limit = 1.87 μM .

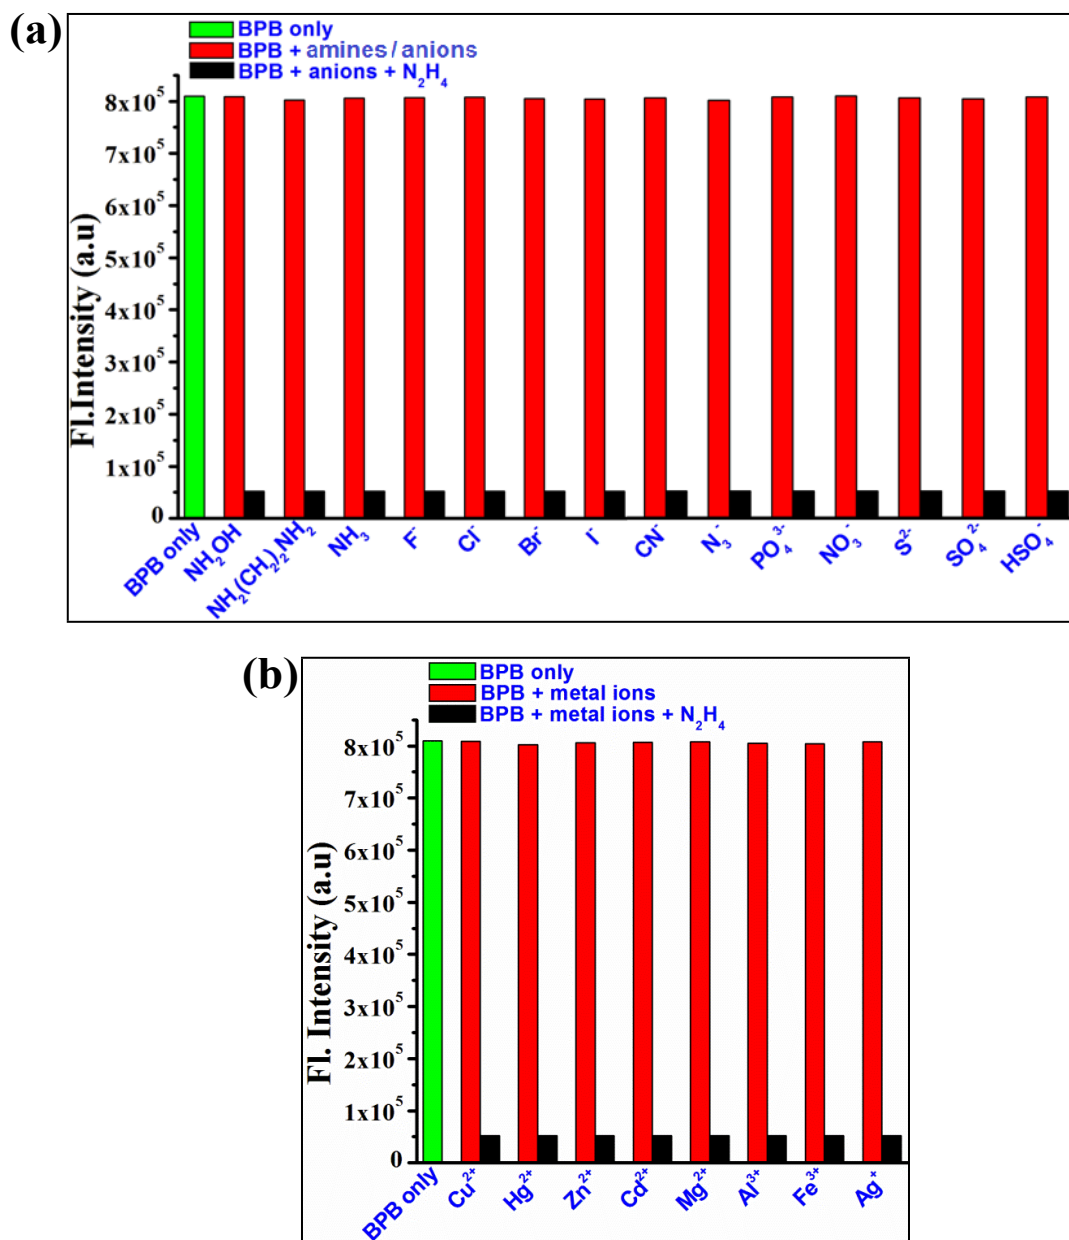

Figure S10. Competition Fluorescence experiments for a BPB-hydrazine system in the presence of coexisting (a) amines/anions and (b) cations. [BPB] = 1×10^{-5} M, 2.0 equiv. of hydrazine ($c = 2 \times 10^{-4}$ M) and 30 equiv of common anions and cations, redox anions and amines ($c = 2 \times 10^{-4}$ M) in H_2O -DMSO (3:7, v/v) solution (10 mM HEPES buffer, pH 7.4).

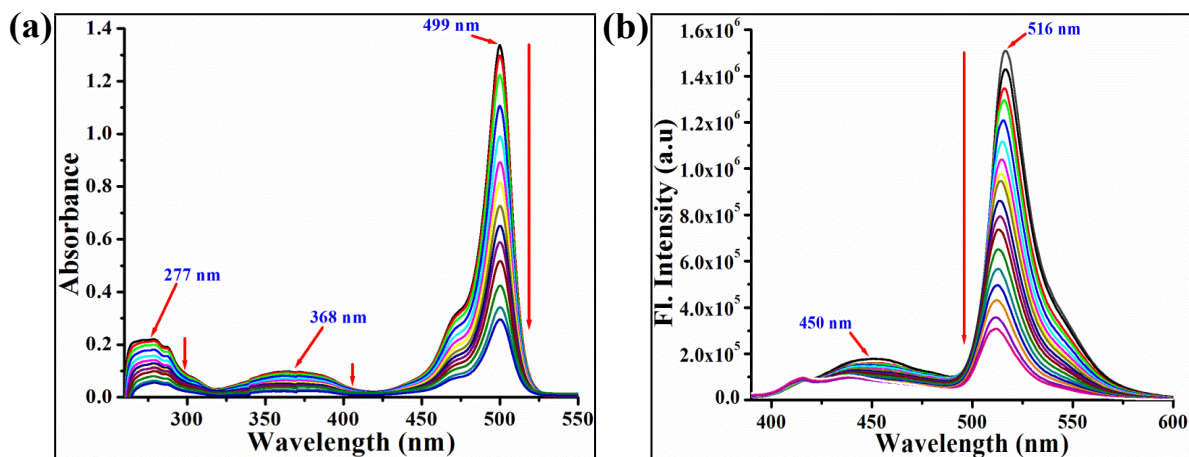

Figure S11. (a) Changes in the UV/vis absorption spectra of compound-2 ($c = 2 \times 10^{-5}$ M) in H₂O–DMSO (3:7, v/v) solution (10 mM HEPES buffer, pH 7.4) in the presence of 0 – 10.0 equiv. of hydrazine and (b) Fluorescence spectra (excitation at 368 nm) of compound-2 ($c = 2 \times 10^{-5}$ M) in H₂O–DMSO (3:7, v/v) solution (10 mM HEPES buffer, pH 7.4) in the presence of 0 – 10.0 equiv. of hydrazine.

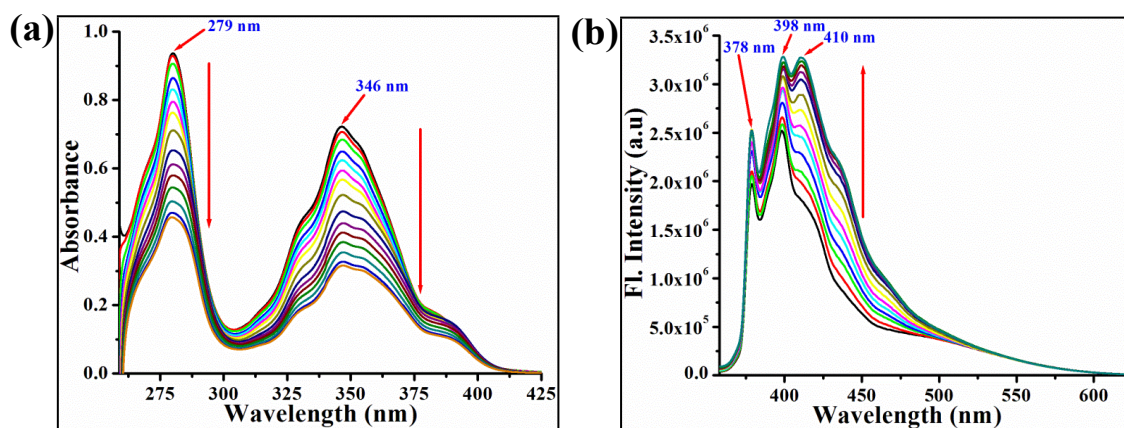

Figure S12. (a) Changes in the UV/vis absorption spectra of γ -oxo-1-pyrenebutyric acid ($c = 2 \times 10^{-5}$ M) in H₂O–DMSO (3:7, v/v) solution (10 mM HEPES buffer, pH 7.4) in the presence of 0 – 20.0 equiv. of hydrazine and (b) Fluorescence spectra (excitation at 346 nm) of γ -oxo-1-pyrenebutyric acid ($c = 2 \times 10^{-5}$ M) in H₂O–DMSO (3:7, v/v) solution (10 mM HEPES buffer, pH 7.4) in the presence of 0 – 20.0 equiv. of hydrazine.

Figure S13. Fluorescence pH titration of **BPB** (1.0×10^{-5} M) in presence (red) and absence (black) of 2.0 equiv. of hydrazine ($c = 2 \times 10^{-4}$ M) at 516 nm in H₂O–DMSO (3:7, v/v) solution.

Computational Method

All the geometries have been optimized at the B3LYP density functional method with 6-31G(d,p) basis set for all atom. A polarizable continuum model (PCM) has been employed to take into account the influence of water as a solvent during optimization. The geometries are verified as proper minima by frequency calculations. To further refine the energy and optical properties single point population analysis and time-dependent density functional theory (TDDFT) calculations have also been performed using triple ζ quality 6-311G(d,p) basis set. All calculations have been performed using Gaussian03 program. All the data presented here are calculated in solvent phase.

Table S1. Selected electronic excitation energies (eV), oscillator strengths (f), main configurations, and CI Coefficients of the low-lying excited states of sensor **BPB**, **3** and **4**. The data were calculated at the TDB3LYP/6-311G(d,p)//B3LYP/6-31G(d,p) level of theory.

Molecules	Electronic Transition	Excitation Energy ^a	f ^b	Composition ^c	(composition) %
BPB	S ₀ → S ₁	2.9040 eV 426.94 nm	0.5740	H → L	98.0
