1. General information

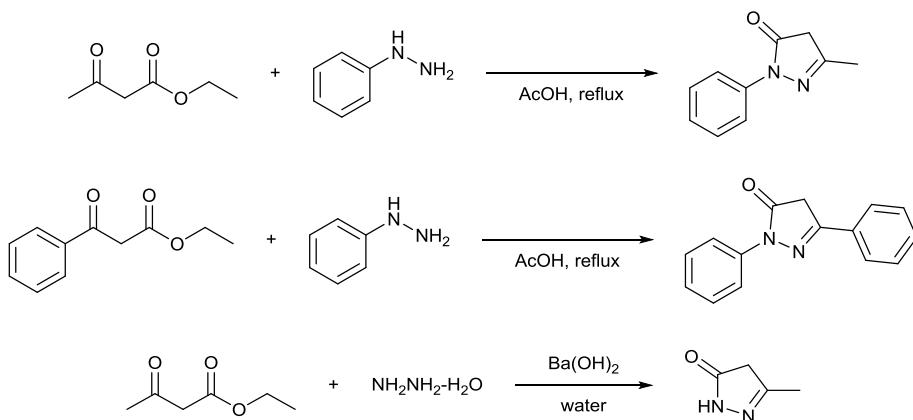

Unless otherwise noted, all reagents and chemicals (AR grade) were purchased from commercial suppliers and used without further purification. All the solvents were treated according to general methods. Anhydrous furanidine (THF) was freshly distilled from sodium. Petroleum ether (PE) refers to the fraction boiling in the 60–90°C range. The progress of the reactions was monitored by TLC (silica gel, Polygram SILG/UV 254 plates). Column chromatography was performed on silica gel (100~200 mesh). All ¹H NMR spectra were recorded on a Bruker Avance II 400 MHz and Bruker Avance III 471 MHz respectively, ¹³C NMR spectra were recorded on a Bruker Avance II 101 MHz or Bruker Avance III 126 MHz. CDCl₃ were used for NMR spectroscopy, using tetramethylsilane as the internal reference. Data for ¹H NMR are recorded as follows: chemical shift (δ , ppm), multiplicity (s = singlet, d = doublet, t = triplet, m = multiplet or unresolved, br = broad singlet, dd = doublet doublet, coupling constants in Hz, integration). Data for ¹³C NMR are reported in terms of chemical shift (δ , ppm). HRMS (ESI) was determined by a HRMS/MS instrument (LTQ Orbitrap XL TM).

2. Typical procedure for substrates preparation

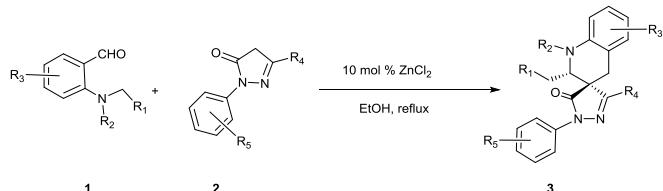

a). The synthesis of 2-(pyrrolidin-1-yl)benzaldehyde¹⁻³.

b). The synthesis of pyrazolones.^{4,5}

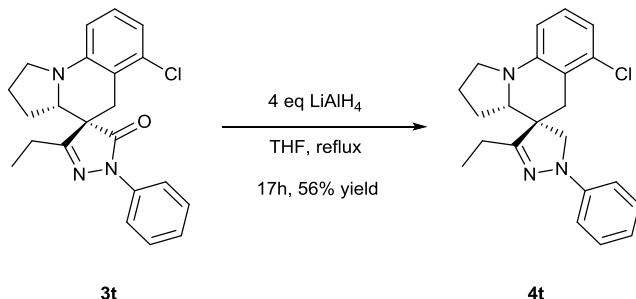

3. General procedure for the intramolecular redox reaction catalyzed by zinc chloride

A mixture of **1** (0.40 mmol), **2** (0.42 mmol) and ZnCl₂ (0.04 mmol) was added solvent (4 mL), then the reaction mixture was stirred at refluxing temperature until the complete consumption of **1** as judged by TLC analysis. When the reactions completed, the reaction

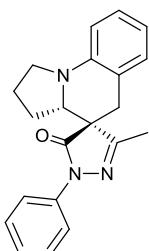

mixture was adsorbed onto silica gel and purified by column chromatography to desired product **3**.

In the argon atmosphere, LiAlH₄ (1.6 mmol, 4eq) was added into **anhydrous** THF (1.0 mL), then the mixture was stirred for 20 min in 0 °C. A solution of **3t** (0.4 mmol, 1 eq) in **anhydrous** THF (1.0 mL) was added into the solution of LiAlH₄ in drops. Then the reaction mixture was stirred at refluxing temperature. After completion of the reaction (17 h) the reaction mixture was quenched with water, extracted with EtOAc. The combined organic layers were washed with water, brine, dried (Na₂SO₄) and concentrated to **4t** in 56% yield. The product **4t** should be preserved under low temperature and oxygen free conditions.
