All reagents were used as received unless otherwise noted. Solvents were purified under nitrogen using a solvent purification system (Innovative Technology, Inc., Model # SPS-400-3 and PS-400-3). Copper (I) chloride (CuCl, Strem, used as received), 1,3-bis-(2,6-diisopropylphenyl)-imidazolium chloride (IPr•HCl, Aldrich, used as received), chloro[1,3-bis(2,6-diisopropylphenyl)imidazol-2-ylidene]copper (CuCl•IPr, Aldrich, used as received), 1,3-dimesitylimidazolium chloride (IMes•HCl, Strem, used as received), potassium *tert*-butoxide (KO*t*Bu, Strem, used as received), and sodium *tert*-butoxide (NaO*t*Bu, Aldrich, used as received) were stored and weighed in an inert atmosphere glovebox. Tris(pentafluorophenyl)borane (B(C₆F₅)₃, Aldrich, used as received) was stored and weighed in an inert atmosphere glovebox but was also found to perform equally well when stored in a vial kept in a desiccator and weighed on the benchtop. Chlorodimethylsilane (Me₂SiHCl, Aldrich) was distilled under N₂ and transferred to a Schlenk flask at 0 °C for storage. Triethylamine (NEt₃, Aldrich) was freshly distilled under N₂ prior to use. Trimethylsilyl trifluoromethylsulfonate (TMSOTf, Aldrich) was distilled under vacuum and transferred to a Schlenk tube for storage. All B(C₆F₅)₃ and Cu/NHC reactions were conducted in flame-dried glassware under a nitrogen atmosphere. Powdered 4 Å molecular sieves were dried overnight before use at 150 °C at less than 1 torr and stored in an oven at 130 °C. ¹H and ¹³C spectra were obtained in CDCl₃ at rt, unless otherwise noted, on a Varian Mercury 400, Varian Unity 500, Varian vnmrs 500, or Varian vnmrs 700 MHz instrument. Chemical shifts of ¹H NMR spectra were recorded in ppm from the central peak of CDCl₃ (7.25 ppm) or CD₃OD (3.31 ppm) on the δ scale. Chemical shifts of ¹³C NMR spectra were recorded in ppm from the central peak of CDCl₃ (77.0 ppm) or CD₃OD (49.0 ppm) on the δ scale. NMR spectra are described using first order analysis. High resolution mass spectra (HRMS) were obtained on a VG-70-250-S spectrometer manufactured by Micromass Corp. (Manchester UK) at the University of Michigan Mass Spectrometry Laboratory.

General Procedure A – Preparation of Sugar Silanes¹

The respective 2-OH or 6-OH sugar (1.0 equiv) was dissolved in dry CH₂Cl₂ (0.2 M) and cooled to 0 °C in an ice bath. Freshly distilled NEt₃ (2.0 equiv) was added and stirred for 3 min, then Me₂SiHCl (1.5 equiv) was added. The reaction was allowed to stir for 4 h. Volatiles were removed by rotary evaporation. The resulting oil was extracted from NaHCO₃ (aq.) (diluted over ice) 3 times with CH₂Cl₂. The combined organic extracts were dried quickly over MgSO₄, filtered, concentrated, and the resulting solid or oil was stored under vacuum or frozen in C₆H₆.

Note – the sugar silanes are stable for months when stored frozen in benzene or under high vacuum. Alternatively, the corresponding 2-OH or 6-OH sugars are very stable to be stored for long periods of time on the bench top.

General Procedure B – $B(C_6F_5)_3$ Promoted Coupling of Alcohols and Sugar Silanes

A mixture of sugar silane (1.0-1.5 equiv) and alcohol (1.0 equiv) was dissolved in dry toluene (0.1 M) at rt under an inert atmosphere (N_2) and stirred until both substrates were completely dissolved. $B(C_6F_5)_3$ (2-4 mol%) was added as a solid under a gentle stream of nitrogen followed by re-attachment of the septum and nitrogen line. Alternatively, a mixture of alcohol (1.0 equiv) and $B(C_6F_5)_3$ (5 mol%) were dissolved in dry toluene (0.1 M) at rt under an inert atmosphere (N_2) with 4 Å MS (400 mg/mmol). Sugar silane (1.5 equiv) was dissolved in toluene (0.5 – 0.75 M) and added slowly over 1 h. Upon completion of the reaction as monitored by TLC, the reaction mixture was either loaded directly onto a column or the volatiles were removed by rotary evaporation and then loaded onto a column for purification by flash chromatography (SiO_2) to afford the desired product. Note – dry CH_2Cl_2 was found to be the optimal co-solvent if a substrate is marginally soluble in toluene.

General Procedure C – $CuCl/NHC\bullet HCl$ and $CuCl\bullet NHC$ Promoted Dehydrogenative Silylation of Alcohols with Sugar Silanes

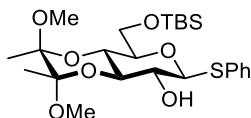

A solid mixture of $CuCl$ (5 mol%), $NHC\bullet HCl$ (5 – 10 mol%), and $KOtBu$ or $NaOtBu$ (5 – 10 mol%) was dissolved in dry $PhCH_3$ (0.015 M) at rt under an inert atmosphere (N_2) and stirred for 15 min. A mixture of alcohol (1.0 equiv), silane (1.1 equiv), and 4 Å MS (0 – 400 mg/mmol) was dissolved in dry $PhCH_3$ (0.1 – 0.2 M) and the catalyst was added to this mixture as a solution in dry $PhCH_3$. Upon completion of the reaction as monitored by TLC, the reaction mixture was filtered through a short plug of silica gel with 50% $EtOAc/hex$ and concentrated by rotary evaporation. The resulting residue was purified via flash chromatography (SiO_2) to afford the desired product.

Alternatively, a solid mixture of $CuCl\bullet NHC$ (5 mol%) and $KOtBu$ or $NaOtBu$ (5 mol%) can be used in the above procedure.

General Procedure D – NIS/TMSOTf Promoted Glycosylation of Silyl-linked Compounds

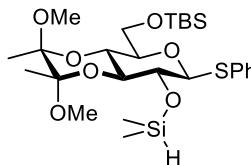

The respective silyl-linked compound (1.0 equiv) was dissolved in dry CH_2Cl_2 (0.02 M) and cooled to -78 or -40 °C. *N*-iodosuccinimide (1.3 – 1.4 equiv) and 2,6-DTBMP (2.0 – 4.0 equiv) were added and stirred for 3 – 5 min. To this solution was added TMSOTf (1.2 – 2.4 equiv) and the reaction was stirred for 5 – 20 min followed by warming to 0 °C unless otherwise noted. Upon disappearance of the silyl-linked compound as monitored by TLC, TBAF (5 equiv, 1 M in THF) was added and the reaction was warmed to rt and stirred overnight. The reaction mixture was quenched with $Na_2S_2O_3$ (sat. aq.) and extracted three times from NH_4Cl (sat. aq.) with CH_2Cl_2 . The combined organic extracts were dried over $MgSO_4$, filtered, and concentrated by rotary evaporation. The resulting residue was purified by flash chromatography (SiO_2) to afford the desired product. Note – All experimentals include a bolded diagnostic 1H NMR peak for the assignment of anomeric stereochemistry.
