General Methods:

Unless otherwise noted, all reactions were carried out in standard Schlenk techniques with magnetic stirring bar under air. Materials obtained from commercial suppliers were used directly without further purification. ^1H NMR spectra were recorded on a BRUKER 400 (400 MHz) spectrometer or a Bruker 300 MHz spectrometer in CDCl_3 . Chemical shifts are reported in ppm with tetramethylsilane (TMS: 0 ppm) with the solvent resonance as the internal standard. Data are reported as follows: chemical shift, multiplicity (s = singlet, d = doublet, t = triplet, q = quartet, m = multiplet), coupling constants (Hz), and integration. ^{13}C NMR spectra were recorded on a BRUKER 400 (100 MHz) spectrometer and a Bruker 300 (75.0 MHz) spectrometer in CDCl_3 with complete proton decoupling. Chemical shifts are reported in ppm with the deuterium solvent as the internal standard (e.g. CDCl_3 : 77.0 ppm). The $[\alpha]_D$ was recorded using PolAAr 3005 High Accuracy Polarimeter. Infrared (IR) spectra were obtained using a Bruker tensor 27 infrared spectrometer. The ee was recorded using UltiMate 3000 HPLC from Dionex Company.

Anhydrous tetrahydrofuran (THF) was dried with sodium benzophenone and distilled before use; anhydrous toluene, 1,2-Dimethoxyethane (DME) and diethyl ether (Et_2O) was purified by distillation over Na prior to use; AgOTf , AgSbF_6 , AgNTf_2 , AgBF_4 , and AgPF_6 were purchased from Alfa-Aesar Company and used directly.

Reactions were monitored by thin layer chromatography (TLC) using silicycle pre-coated silica gel plates. Flash column chromatography was performed on silica gel 60 (particle size 200-400 mesh ASTM, purchased from Yantai, China) and eluted with hexane/ethyl acetate or hexane/ CH_2Cl_2 .

Preparation and Characterization of 3-vinylindoles

All 3-vinylindole substrates were synthesized according to our previous procedure.^[1] The spectra of known compounds such as **1a**, **1b** are consistent with the literature, which are not included here except **1a** as a typical procedure.

Typical Procedure for synthesis of 3-styrylindoles.

$n\text{-BuLi}$ (2.5 M in hexane solution) (9.6 mL, 24 mmol) was slowly added to the suspension of BnPPH_3Br (10.39 g, 24 mmol) in dry THF (130 mL) at $-20\text{ }^\circ\text{C}$. The mixture was stirred at room temperature for 2 h followed by the addition of **S1** (3.18 g, 20 mmol) in THF (20 mL) at $-20\text{ }^\circ\text{C}$. Then the mixture was stirred at room temperature for 2 hours, monitored by TLC and quenched by saturated solution of NH_4Cl at room temperature. The extracts with ethyl acetate were washed by Saturated salt water and dried over anhydrous sodium sulfate, then the solvent was removed under reduced pressure. The crude product was purified by column chromatography to give (E)-Product (2.70 g, 58%) as a white solid and (Z)-product (1.86 g, 40%) as a colorless liquid.

General Procedure A for asymmetric gold-catalyzed [2+2]-cycloaddition.

The solution of (*S,R,R*)-**L2**AuCl (1.0 mol %) and AgNTf₂ (1 mol %) in DCM (1 mL) was stirred at rt for 15 min., Then the above catalyst solution then was added to the solution of **1** (0.2 mmol) and **2** (0.18 mmol) in DCM (3 mL) at -60 °C. The reaction was determined by TLC, after the less component was consumed, the solution was removed under reduced pressure. The diastereomeric ratio was determined by crude 1H NMR, the resulting crude mixture was purified by flash column chromatography on silica gel with petroleum ether/ ethyl acetate (20:1) as the solvent to afford product. The enantiomeric excesses of the products were determined by chiral stationary phase HPLC using a Chiralpak AD-H, AS-H, OD-H.

General Procedure B for asymmetric gold-catalyzed [4+2] cycloaddition

The solution of (*S,R,R*)-**L2**AuCl (2.5 mol %) and AgNTf₂ (2.5 mol %) in DCE (1 mL) was stirred at rt for 15 min., Then the above catalyst solution then was added to the solution of **1** (0.2 mmol) and **2** (0.18 mmol) in DCE (3 mL) at -30 °C. The reaction was determined by TLC, after the less component was consumed, the solution was removed under reduced pressure. The diastereomeric ratio was determined by crude 1H NMR, the resulting crude mixture was purified by flash column chromatography on silica gel with petroleum ether/ DCM (1:1) as the solvent to to afford product. The enantiomeric excesses of the products were determined by chiral stationary phase HPLC using a Chiralpak AD-H, AS-H, OD-H, OD-3.

Section 1: Computational methods

The Density Functional Theory (DFT) calculations were carried out using the Gaussian 09 program package [1]. The molecular geometrical structures were optimized using the M06 [2] functional combined with the Lanl2dz with the effective core potential (ECP) [3] and 6-31G* basis sets. The Lanl2dz basis set with the ECP was used to describe the Au atom and the other nonmetal atoms C, O, P, H were described by the 6-31G* basis set. The frequency calculations were performed on the optimized structures obtained in the gas phase to verify the minima or transition states on potential surfaces. The solvent effects of dichloromethane were considered by performing the calculations of solvation corrections using the polarizable continuum model (PCM) [4] model. The intrinsic reaction coordinate (IRC) [5] calculations were also performed to assure that the transition states connected the correct intermediates in the forward and reverse directions.

Figure 2': The free energy profiles ΔG_{sol} for the (Z) or (E)-selectivity of the [2+2] cycloaddition product.

The complete (Z)-selectivity of the [2+2] cycloaddition product can also be easily explained by computational calculations. The Int'-C is formed from the Int'-B through $\text{TS}'\text{-2}^{\text{Me}}$. Because the Int'-B is less stable than Int-B ($\Delta E_{\text{Int-B} - \text{Int}'\text{-B}} = -5.2 \text{ kcal mol}^{-1}$), and in the second transition state, the ring closure of Int'-B may be disfavored by the stereoelectronic effect ($E_{\text{TS-2Me}} = -1.0 \text{ kcal mol}^{-1}$ vs $E_{\text{TS}'\text{-2Me}} = 6.8 \text{ kcal mol}^{-1}$).

Section 3: Electrostatic potentials of 1a and 1e

Figure S2. It shows the calculated contour maps of electrostatic potentials corresponding to the (a) **1a** and (b) **1e** in Figure 2, respectively. The colorful bars in the plots denote the values of electrostatic potentials ranging from -0.04 to 0.04, in the units of volt. The arrows indicate the first carbonic addition positions of **1a** and **1e** with the Au-allyl species **Int-A**.
