## Materials and methods

Syntheses: Unless otherwise stated, no attempts were made to exclude air in the syntheses of $\mathbf{1 - 1 2}$. Acetone (technical), chloroform (Sigma-Aldrich, HPLC, $\geq 99.8 \%$ ), chloroform- $d$ (Sigma-Aldrich, 99.8\% D), dichloromethane (Sigma-Aldrich, HPLC, $\geq 99.8 \%$ ), dichloromethane- $d 2$ (Sigma-Aldrich, $99.9 \% \mathrm{D}$ ), diethyl ether (VWR Chemicals), hexane (Sigma-Aldrich, HPLC, $\geq 97.0 \%$ ), pentane (Sigma-Aldrich, HPLC, $\geq 99.0 \%$ ), toluene (technical, VWR Chemicals), and petroleum ether (VWR Chemicals, boiling point $\left.40-65^{\circ} \mathrm{C}\right)$ were bought from commercial suppliers and used as received. $\left[\mathrm{Ru}(\mathrm{C}) \mathrm{Cl}_{2}\left(\mathrm{PCy}_{3}\right)_{2}\right](\mathbf{R u C})$ was synthesized according to the published procedure (Johnson ${ }^{1}$ ); $\mathbf{R u} \mathbf{u}^{13} \mathbf{C}$ was obtained with ${ }^{13} \mathrm{CH}_{2}{ }^{13} \mathrm{CHOAc} \quad$ (Sigma-Aldrich, $\left.\quad 99 \% \quad{ }^{13} \mathrm{C}\right) . \quad[\mathrm{RhCl}(\mathrm{cod})]_{2},{ }^{2} \quad[\mathrm{IrCl}(\operatorname{cod})]_{2},{ }^{3} \quad\left[\mathrm{RhCl}(\mathrm{CO})_{2}\right]_{2},{ }^{4}$ (PNP) $\left[\operatorname{IrCl}_{2}(\mathrm{CO})_{2}\right],{ }^{5}\left(\mathrm{AsPh}_{4}\right)\left[\mathrm{PtCl}_{3}\left(\mathrm{C}_{2} \mathrm{H}_{4}\right)\right],{ }^{6}$ trans- $\left[\mathrm{PtCl}_{2}\left(\mathrm{C}_{2} \mathrm{H}_{4}\right)(\mathrm{py})\right],{ }^{7}$ cis- $\left[\mathrm{PtCl}_{2}(\mathrm{dmso}-\mathrm{S})_{2}\right],{ }^{8}[\mathrm{Ag}(4-\mathrm{Ph}-$ terpy) $] \mathrm{OTf},{ }^{9}\left[\mathrm{AuCl}\left(\mathrm{SC}_{4} \mathrm{H}_{8}\right)\right],{ }^{10}$ and $\left[\mathrm{AuCl}\left(\mathrm{PPh}_{3}\right)\right]^{11}$ were prepared according to published procedures. $(\mathrm{PNP})_{2}\left[\mathrm{Pd}_{2} \mathrm{Cl}_{6}\right]^{12}\left(\mathrm{PNP}^{+}\right.$replacing $\left.\mathrm{AsPh}_{4}{ }^{+}\right),\left[\mathrm{Ag}(\mathrm{tht})_{2}\right] \mathrm{OTf}^{13}\left(\mathrm{OTf}{ }^{-}\right.$replacing $\left.\mathrm{ClO}_{4}^{-}\right)$, and $[\mathrm{Ag}(4-\mathrm{Ph}-$ terpy)]OTf ${ }^{9}$ (terpy replacing 4'-Ph-terpy) were prepared by the obvious modifications of published procedures.

## Physical measurements

NMR-spectroscopy: ${ }^{31} \mathrm{P}\left\{{ }^{1} \mathrm{H}\right\}-\mathrm{NMR}$ and ${ }^{19} \mathrm{~F}-\mathrm{NMR}$ spectra were recorded on a 300 MHz Varian instrument. ${ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$-NMR spectra were recorded on a 500 MHz Bruker instrument with a cryoprobe, and ${ }^{1} \mathrm{H}-$ NMR spectra were recorded on a 300 MHz Varian instrument or a 500 MHz Bruker instrument with a cryoprobe. For ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$, residual solvent signals were used for calibration $\left(\mathrm{CDCl}_{3}: \delta=7.26\right.$ and $77.16 \mathrm{ppm}, \mathrm{CD}_{2} \mathrm{Cl}_{2}: \delta=5.33$ and 54.24 ppm , for ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$, respectively). For ${ }^{31} \mathrm{P}$ and ${ }^{19} \mathrm{~F}$, the signals were referenced to the deuterium resonances arising from the solvents.

Mass spectrometric measurements were carried out on a Jeol four sector instrument (FAB, mnitrobenzylalcohol as matrix) or on a Bruker Solarix XR ESI/MALDI FT-ICR MS instrument (ESI, acetonitrile added formic acid as solvent).

Elemental analyses were performed by the microanalytical services of the Department of Chemistry, University of Copenhagen.

IR spectra of solid samples of $\mathbf{3}$ and $\mathbf{4}$ were recorded with and Agilent Technologies Cary 630 FTIR instrument.

Raman experiments were performed by placing some powder on a clean cover slip on top of an Olympus IX71 microscope aligned with a 632.8 nm HeNe CW laser (Thorlabs HRR170-1). The laser source was spectrally cleaned by a narrow bandpass filter centered at 633 nm (Semrock LL01-633-25). In the microscope the laser light was reflected on a dichroic mirror (Semrock LP02-633RU-25) towards a 100X 1.3 NA immersion oil objective (Olympus UplanFL N) that focused the laser from below on the sample. The power of the laser focused at the sample was $635 \mu \mathrm{~W}$ (approximately $230 \mathrm{~kW} / \mathrm{cm}^{2}$ ). The Raman signal was collected back through the objective. A 633 nm longpass filter (Semrock LP02-633RU-25) was used to block the 632.8 nm laser light in the detection path. The Raman spectrum was recorded using a PI Acton SpectraPro SP-2356 polychromator ( $1200 \mathrm{~g} \mathrm{~mm}^{-1}$ blazed at 500 nm ) and a PI Acton SPEC10:100B/LN_eXcelon Spectroscopy System with a back-illuminated CCD chip ( 1340 x 100 pixels).

X-ray crystallographic studies: single crystals of all complexes were coated with mineral oil, picked up with nylon loops, and mounted immediately in the nitrogen cold stream of the diffractometer to prevent solvent loss.

Single-crystal X-ray diffraction studies of $(\mathbf{1}, \mathbf{3}, \mathbf{6}, \mathbf{8}, \mathbf{9}, \mathbf{1 0}, \mathbf{1 1}$, and $\mathbf{1 2})$ were performed at $122(2) \mathrm{K}$ on a Nonius KappaCCD area-detector diffractometer, equipped with an Oxford Cryostreams low-temperature device, using graphite-monochromated Mo $K_{\alpha}$ radiation ( $\lambda=0.71073 \AA$ ), using $\omega$ and $\varphi$ scans with a scan width of $1.0^{\circ}$ and exposure times of 60 s , using the program COLLECT. ${ }^{14}$ The crystal-to-detector distance was 35.0 mm . The program EVALCCD ${ }^{15}$ was used for data reduction, and the data were corrected for absorption by integration. The structures were solved with direct methods using SHELXS ${ }^{16}$ and refined by least-squares methods using SHELXL97. ${ }^{17}$ All non-hydrogen atoms were refined anisotropically. Hydrogen atoms were located in the difference Fourier map and refined isotropically ( $U_{\text {iso }}=1.2 U_{\text {eq }}$ of the parent atom, except for methyl hydrogens which were constrained to $1.5 U_{\text {eq }}$ of the parent atom) and constrained riding their parent atom in a fixed geometry.

Single-crystal X-ray diffraction studies of (2, 4, 5, and 7) were performed at 122(2) K on a Bruker D8 VENTURE diffractometer equipped with a Mo $K_{\alpha}$ high-brilliance $\mathrm{I} \mu$ S radiation source ( $\lambda=0.71073 \AA$ ), a multilayer X-ray mirror and a PHOTON 100 CMOS detector, and an Oxford Cryosystems low temperature device. The instrument was controlled with the APEX2 software package using SAINT. ${ }^{18}$ Final cell constants were obtained from least squares fits of several thousand strong reflections. Intensity data were corrected for absorption using intensities of redundant reflections with the program SADABS. ${ }^{19}$ The structures were readily solved in Olex2 using the olex2.solve ${ }^{20}$ structure solution program (Charge Flipping) and refined using the olex2.refine program ${ }^{21}$ or SHELXL. ${ }^{17}$ All nonhydrogen atoms were refined anisotropically and hydrogen atoms were placed at calculated positions and refined as riding atoms with isotropic displacement parameters ( $U_{\text {iso }}=1.2 U_{\text {eq }}$ of the parent atom, except for methyl hydrogens which were constrained to $1.5 U_{\text {eq }}$ of the parent atom).

Disorder in solvent molecules and cyclohexyl groups was treated with appropriate choices of the EADP, ISOR, and SADI commands. CCDC numbers 1403006 - 1403017 contain the crystallographic data reported herein. These data can be obtained free of charge from The Cambridge Crystallographic Data Centre via www.ccdc.cam.ac.uk/data_request/cif. Selected crystallographic details are listed in Table S1 below.

Substitution kinetics in $\boldsymbol{c i s}$ - $\left.\mathbf{P t C l}_{\mathbf{2}} \mathbf{( d m s o}\right)_{\mathbf{2}}$. A solution of $\mathbf{R u C}(1.9 \mathrm{mg}, 2.6 \mu \mathrm{~mol})$ in $\mathrm{CD}_{2} \mathrm{Cl}_{2}$ was added to a solution of cis $-\mathrm{PtCl}_{2}(\mathrm{dmso})_{2}(1.1 \mathrm{mg}, 2.6 \mu \mathrm{~mol})$ in $\mathrm{CD}_{2} \mathrm{Cl}_{2}$, yielding a final volume of 0.9676 ml $(1.314 \mathrm{~g})$. The mixture was shaken immediately and mounted on a Bruker 500 MHz NMR machine. 180 s after mixing, 33 consecutive ${ }^{1} \mathrm{H}$-NMR spectra were recorded. The integrals (s) from the dmso ligands coordinated in cis $-\mathrm{PtCl}_{2}(\mathrm{dmso})_{2}$ were scaled to produce an intercept at $t=0 \mathrm{~s}$ corresponding to the initial concentration of $\mathrm{cis}-\mathrm{PtCl}_{2}(\mathrm{dmso})_{2}(2.7 \mathrm{mM})$ in a plot of the inverse concentration versus time. The slope from the linear fit corresponds to the second-order rate constant, $k_{2}=0.27(3) \mathrm{M}^{-1} \mathrm{~s}^{-1}$. The data from the $1^{\text {st }}$ and $23^{\text {rd }}$ measurement (marked with gray, see Figure S 16 ) were excluded from the data treatment.
