General Considerations. All compounds and reactions reported below show various levels of air- and moisture-sensitivity, so all manipulations were carried out using standard vacuum-line, Schlenk-line and glovebox techniques. Solvents were sparged with argon before being deoxygenated and dried by passage through Q5 and activated alumina columns, respectively. To test for effective oxygen and water removal, aliquots of each solvent were treated with a few drops of a purple solution of sodium benzophenone ketyl radical in THF. The reagents Ni(cod)₂ (Strem), 3,5-di-*tert*-butyl-1,2-quinone (Aldrich), and 4,4'-di-*tert*-butyl-2,2'-bipyridine (Aldrich) were reagent grade or better and used as received. The iminoquinones, 3,5-di-*tert*-butyl(2,6-diisopropylphenyl)-*ortho*-iminoquinone¹ and 9,10-(2,6-diisopropylphenyl)iminophenanthrenquinone² were prepared according to literature procedures. Elemental analyses were performed on a PerkinElmer series II 2400 CHNS analyzer.

Spectroscopic Measurements. NMR spectra were collected at 298 K on a Bruker Avance 400 MHz or 500 MHz spectrometer in dry, degassed C₆D₆ or CDCl₃. ¹H and ¹³C NMR spectra were referenced to tetramethylsilane (TMS) using the residual ¹H and ¹³C impurities of the deuterated solvent.³ All chemical shifts are reported using the standard δ notation in parts per million; positive chemical shifts are to a higher frequency of TMS. Electronic absorption spectra were recorded with a PerkinElmer Lamda 900 UV-vis-NIR Spectrometer using one-centimeter path-length cells at ambient temperature (20-24 °C).

Electrochemical Methods. Electrochemical experiments were recorded on a Gamry Series G300 potentiostat/galvanostat/ZRA (Gamry Instruments, Warminster, PA) using a 3.0 mm glassy carbon working electrode, a platinum wire auxiliary electrode, and a silver wire pseudo-reference electrode. Reversibility of a redox process was judged based on the ratio of the anodic to the cathodic current being close to unity ($i_{pa}/i_{pc} \cong 1$) for a given process. Electrochemical experiments were performed at ambient temperature (20-24 °C) in a nitrogen-filled glovebox using THF solutions containing 1 mM analyte and 100 mM [NBu₄][PF₆] as the supporting electrolyte. All potentials are referenced to [Cp₂Fe]^{+/-} using ferrocene or decamethylferrocene (-0.49 V vs [Cp₂Fe]^{+/-})⁴ as internal standards. Ferrocene and decamethylferrocene (Acros) were purified by sublimation under reduced pressure and tetrabutylammonium hexafluorophosphate (Acros) was recrystallized from ethanol three times and dried under vacuum.

X-ray Data Collection and Reduction. X-ray diffraction data for all complexes were collected on single crystals mounted on either a glass fiber or a cryoloop and coated with oil. Data were acquired using a Bruker SMART APEX II diffractometer at 143 K using Mo K α radiation ($\lambda = 0.71073 \text{ \AA}$). The APEX2⁵ program package was used to determine unit-cell parameters and for data collection. The raw frame data were processed using SAINT⁶ and SADABS⁷ to yield the reflection data file. Subsequent refinement cycles were carried out using the SHELXTL program suite.⁸ Analytical scattering factors for neutral atoms were used throughout the analyses.⁹ ORTEP diagrams were generated using ORTEP-3 for Windows.¹⁰ Diffraction data for **1**, **2**, and **3** are given in Table S1.

Density Functional Theory Computations. Calculations were performed in the Molecular Modeling Facility in the Department of Chemistry at UC Irvine. Calculations

were performed employing Meta-GGA functional TPSS.¹¹ Geometry optimizations were initiated using a split-valence plus polarization basis set (def2-SVP)¹² and further refined using the polarized triple- ζ basis set def2-TZVP.¹³ Structures obtained from single-crystal X-ray diffraction experiments were used as the starting points for geometry optimizations; no molecular symmetry was imposed. For complexes **1** and **3**, molecular geometries and orbital energies were evaluated self-consistently to tight convergence criteria (energy converged to 0.1 μ Hartree, maximum norm of the Cartesian gradient $\leq 10^{-4}$ a.u.). For complex **2**, ultra tight convergence criteria (0.01 μ Hartree, maximum norm of the Cartesian gradient $\leq 10^{-6}$ a.u.) yielded a single imaginary frequency (-6 cm^{-1}) that was identified as numerical noise upon vibrational analysis. Mulliken population analyses were obtained at TPSS/TZVP theory level; the contour values were 0.03 for the molecular orbital plots. All calculations were performed using the quantum chemistry program package TURBOMOLE.^{14,15}

Synthesis of (cat)Ni(bpy^tBu₂) (1**).** A benzene solution of a Ni(cod)₂ (138 mg, 0.50 mmol, 1.0 equiv) and 3,5-bis(*tert*-butyl)-1,2-benzenedione (110 mg, 0.50 mmol, 1.0 equiv) was stirred at ambient glovebox temperature for one hour. Solid 4,4'-di-*tert*-butyl-2,2'-bipyridine (134 mg, 0.50 mmol, 1.0 equiv) was then added to the solution and stirring was continued for 2 days. The volume of the resulting dark blue solution was reduced and pentane was added to yield the product as a blue crystalline solid in 80% yield (219 mg).

X-ray quality crystals were grown by vapor diffusion of diethyl ether into a solution of **1** in benzene.

Synthesis of (ap)Ni(bpy'Bu₂) (2**).** A benzene solution of a Ni(cod)₂ (138 mg, 0.50 mmol, 1.0 equiv) and 3,5-di-*tert*-butyl(2,6-diisopropylphenyl)-*ortho*-iminoquinone (190 mg, 0.50 mmol, 1.0 equiv) was stirred at ambient glovebox temperature for one hour. Solid 4,4'-di-*tert*-butyl-2,2'-bipyridine (134 mg, 0.50 mmol, 1.0 equiv) was then added to the solution and stirring was continued for 2 days. The solvent was stripped from the resulting dark yellow-green solution and the solid residue was redissolved in toluene, diluted with pentane, and chilled to -35 °C. The precipitated solid was collected by filtration, washed with cold pentane, and dried under reduced pressure to obtain the desired product as a black crystalline solid in 66% yield (215 mg). X-ray quality crystals were obtained from concentrated solution of **2** in benzene.
