IX. References ..... 70

## I. General Comments

All the reactions were carried out in a pre-dried screwcapped tube with a Teflon-lined septum under $\mathrm{N}_{2}$ atmosphere. Diaryliodonium salts except $\mathrm{Ph}_{2} \mathrm{IPF}_{6}$ and $\left(4-{ }^{t} \mathrm{Bu}-\mathrm{Ph}\right)_{2} \mathrm{IOTf}$ were prepared according to the literatues ${ }^{[1]}$. Column chromatography was performed on silica gel (particle size $10-40 \mu \mathrm{~m}$, Ocean Chemical Factory of Qingdao, China). ${ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on a JEOL AL-300MHz, AL-400MHz or AL-600MHz spectrometer at ambient temperature with $\mathrm{CDCl}_{3}$ as the solvent. Chemical shifts ( $\delta$ ) were given in ppm, referenced to the residual proton resonance of $\mathrm{CDCl}_{3}(7.26)$, to the carbon resonance of $\mathrm{CDCl}_{3}$ (77.16). Coupling constants ( $J$ ) were given in Hertz (Hz). The term m, dq, q, t, d, s referred to multiplet, doublet quartet, quartet, triplet, doublet, singlet.

HRMS experimets were carried out on a Thermo Scientific LTQ Orbitrap Discovery (Bremen, Germany). Melting points were gained by mini-Lamp. MS data were monitored by GC-MS. The reaction progress was monitored by TLC and GC-MS if applicable.

## II. Experimental Procedures for the Preparation of Starting Materials

1. General Procedure for Preparing Oximes $(1 a-1 h, 1 m)^{[2]}$

Methoxylamine hydrochloride ( 1.5 equiv) and NaOAc ( 2.5 equiv) were placed in a schlenk tube and charge with $\mathrm{N}_{2}$. Solvent, $\mathrm{H}_{2} \mathrm{O}(10 \mathrm{ml}) / \mathrm{MeOH}(5 \mathrm{~mL})$, were added into the tube alongside with ketone ( 5 mmol ) and the mixture was stirred at $80^{\circ} \mathrm{C}$ for $5 h$. After cooling down to room temperature, dichloromethane $(10 \mathrm{~mL})$ and water ( 10 mL ) were added. The aqueous layer was extracted with dichloromethane and the combined organic extracts were dried over $\mathrm{MgSO}_{4}$, filtered, and concentrated under reduced pressure.
Note: Aimed ketoximes were obtained quantitively after concentration under reduced pressure without any further purification.

## 2. Procedure for Preparing Compound 1i ${ }^{[2]}$

Fenchone
A stirred solution of fenchone ( $5.0 \mathrm{mmo}, 760 \mathrm{mg}$ ) and methoxylamine hydrochloride ( 5.5 mmol, 456.5 mg ) in pyridine ( 10 mL ) was heated at $115^{\circ} \mathrm{C}$ for overnight. Pyridine was removed under reduced pressure. The residue was diluted with diethyl ether ( 10 mL ) and then washed with water ( 10 mL ). The organic phase was dried over $\mathrm{MgSO}_{4}$, filtered, and evaporated under reduced pressure. The residue was purified by column chromatography on silica gel to give desired $\mathbf{1 i}(500 \mathrm{mg}, 55 \%)$.
3. Procedure for Preparing Compound $1 \mathrm{j}^{[3]}$

$\mathrm{PtO}_{2}(0.05 \mathrm{mmol}, 11 \mathrm{mg})$ in 50 mL THF were placed in a round bottom flask. (+)-Carvol $(10 \mathrm{mmol}, 1.56 \mathrm{~mL})$ was slowly added and the mixture was stirred at room temperature under
an atmosphere of hydrogen gas (balloon). Progress was monitored by GC/MS with full conversion achieved after 5.5 h . The resulting mixture was filtered through celite and washed with EtOAc $(10 \mathrm{ml} \times 3)$. The filtrate was evaporated under reduced pressure and the pure 5-isopropyl-2-methylcyclohex-2-enone were obtained by column chromatography on silica gel (Hexane/EtOA = 1/50). $(1.31 \mathrm{~g}, 86 \%)$.

The aimed product ( $\mathbf{1 j}$ ) ( $1.45 \mathrm{~g}, 93 \%$ ) were prepare from 5-isopropyl-2-methylcyclohex -2-enone according to the general procedure for preparing oximes above.

## 4. Procedure for Preparing Compound $1 \mathbf{k}^{[3,4]}$

Lanosterol
$\mathrm{PtO}_{2}(0.05 \mathrm{mmol}, 11 \mathrm{mg})$ in 50 mml THF were placed in a round bottom flask and Lanosterol ( $10 \mathrm{mmol}, 4.26 \mathrm{~g}$ ) was slowly added. The mixture was stirred at room temperature under an atmosphere of hydrogen gas (balloon). Progress was monitored by GC/MS with full conversion achieved after 6 h . The resulting mixture was filtered through celite and washed with EtOAc. The filtrate was evaporated under reduced pressure and the residue was used without further purification. To a stirred solution of the residue in dichloromethane ( 100 mL ) was added Dess-Martin periodinane ( $15 \mathrm{mmol}, 6.36 \mathrm{~g}$ ). After stirring for one hour at room temperature, $100 \mu \mathrm{l}$ water was added into the mixture to accelerate the conversion. The reaction was quenched after another 3 h . The resulting mixture was extracted with EtOAc (50 $\mathrm{ml} \times 3$ ) while the organic layers were combined, dried over $\mathrm{MgSO}_{4}$, filtered, and concentrated. The residue was purified by column chromatography on silica gel (Hexane/EtOA $=1 / 30$ ) to give the ketone. $(3.00 \mathrm{~g}, 70 \%)$.

Hydroxylamine hydrochloride ( $1.58 \mathrm{~g}, 18.8 \mathrm{mmol}$ ) and $\mathrm{NaOAc}(2.51 \mathrm{~g}, 30.8 \mathrm{mmol})$ were added to the above ketone $(3 \mathrm{~g}, 7 \mathrm{mmol})$ in $\mathrm{H}_{2} \mathrm{O}(20 \mathrm{~mL}) / \mathrm{MeOH}(10 \mathrm{~mL}) / \mathrm{DCM}(5 \mathrm{~mL})$ and the mixture was stirred at $75{ }^{\circ} \mathrm{C}$ for 4 h . After cooling down to room temperature, EtOAc ( 15 mL ) and water ( 10 mL ) were added. The aqueous layer was extracted with EtOAc ( 15 mL x 3) and the combined organic extracts were dried over $\mathrm{MgSO}_{4}$, filtered, and concentrated under reduced pressure. The residue was purified by column chromatography on silica gel $($ Hexane $/ \mathrm{EtOAc}=50 / 1)$ to afford ketoxime $\mathbf{1 k}(2.96 \mathrm{~g}, 93 \%)$.

## 5. Procedure for Preparing Compound $11^{[5,6]}$

To a solution of Glycyrrhetinic Acid ( $2.35 \mathrm{~g}, 5 \mathrm{mmol}$ ) in dichloromethane ( 50 mL ) was added Dess-Martin periodinane ( $5.5 \mathrm{mmol}, 2.33 \mathrm{~g}$ ). After stirring for 1 h at room temperature, $100 \mu \mathrm{l}$ water was added into the mixture to facilitate the conversion. The reaction was quenched after another 3 h and the resulting mixture was extracted with $\mathrm{EtOAc}(30 \mathrm{ml} \times 3$ ). The organic layers were combined, dried over $\mathrm{MgSO}_{4}$, filtered and concentrated without further purification to give the corresponding ketone ${ }^{[6]}$ quantitively.

Solid $\mathrm{K}_{2} \mathrm{CO}_{3}(3.12 \mathrm{~g}, 22.5 \mathrm{mmol})$ as well as neat $\mathrm{MeI}(4.67 \mathrm{~mL}, 75.3 \mathrm{mmol})$ were added to a room temperature DMF solution ( 30 mL ) of glycyrrhetic acid ( $2.35 \mathrm{~g}, 5 \mathrm{mmol}$ ). After stirring for 8 h , solution was filtered followed by evaporating filtration. The residual DMF was portioned between $\mathrm{H}_{2} \mathrm{O}(200 \mathrm{~mL})$ and $\mathrm{EtOAc}(200 \mathrm{~mL})$ while aqueous layer was separated and extracted with EtOAc. Then the combined organic layers were washed with $5 \% \mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$, saturated $\mathrm{NaHCO}_{3}$, brine and then dried $\left(\mathrm{Mg}_{2} \mathrm{SO}_{4}\right)$. Concentration afforded the crude ester that was purified by chromatography ( $1: 20 \mathrm{EtOAc} /$ hexanes ) to afford corresponding ester (11') as a white solid ( $1.70 \mathrm{~g}, 73 \%$ ). ${ }^{[5]}$

Hydroxylamine hydrochloride ( $677 \mathrm{mg}, 8.1 \mathrm{mmol}$ ) and $\mathrm{NaOAc}(1.08 \mathrm{~g}, 13.2 \mathrm{mmol})$ were added to the above ketone $(1.45 \mathrm{~g}, 3 \mathrm{mmol})$ in $\mathrm{H}_{2} \mathrm{O}(10 \mathrm{~mL}) / \mathrm{MeOH}(5 \mathrm{~mL}) / \mathrm{DCM}(2.5 \mathrm{~mL})$ and the mixture was stirred at $75^{\circ} \mathrm{C}$ for 4 h . After cooling down to room temperature, EtOAc $(10 \mathrm{~mL})$ and water $(10 \mathrm{~mL})$ were added. The aqueous layer was extracted with EtOAc ( 15 mL x 3 ) and the combined organic extracts were dried over $\mathrm{MgSO}_{4}$, filtered, and concentrated under reduced pressure. 11 can be obtained quatitively after concentration.

## 6. Spectroscopic Data of Prepared Oximes

(E)-2-methylcyclohexanone $\boldsymbol{O}$-methyl oxime (1a): colorless liquid.
 ${ }^{1} \mathrm{H}$ NMR ( 400 MHz, CHLOROFORM-D) $\delta 3.81(\mathrm{~s}, 3 \mathrm{H}), 2.84-2.71(\mathrm{~m}, 1 \mathrm{H}), 2.36-$ $2.27(\mathrm{~m}, 1 \mathrm{H}), 2.11-2.03(\mathrm{~m}, 1 \mathrm{H}), 1.88-1.76(\mathrm{~m}, 1 \mathrm{H}), 1.75-1.64(\mathrm{~m}, 2 \mathrm{H}), 1.54-$ $1.44(\mathrm{~m}, 2 \mathrm{H}), 1.40-1.33(\mathrm{~m}, 1 \mathrm{H}), 1.10(\mathrm{~d}, \mathrm{~J}=6.8 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( 101 MHz , CHLOROFORM-D) $\delta 163.0,61.1,36.8,35.4,26.3,24.1,24.0,17.3$. EI-MS: $141\left(\mathrm{M}^{+}\right)$
pentan-3-one $\boldsymbol{O}$-methyl oxime (1b): colorless liquid

${ }^{1} \mathrm{H}$ NMR ( 301 MHz, CHLOROFORM-D) $\delta 3.79(\mathrm{~s}, 3 \mathrm{H}), 2.28(\mathrm{q}, J=7.6 \mathrm{~Hz}, 2 \mathrm{H}), 2.17$ $(\mathrm{q}, J=7.6 \mathrm{~Hz}, 2 \mathrm{H}), 1.07(\mathrm{t}, J=5.5 \mathrm{~Hz}, 2 \mathrm{H}), 1.03(\mathrm{t}, J=5.5 \mathrm{~Hz}, 1 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (76 MHz, CHLOROFORM-D) $\delta 163.5,61.1,27.1,21.2,11.3,10.5$. EI-MS: $115\left(\mathrm{M}^{+}\right)$

3-methylbutan-2-one $\boldsymbol{O}$-methyl oxime (1c): colorless liquid; obtained as a mixture of two isomers in a ratio $\mathrm{E} / \mathrm{Z}=6: 1$
 major isomer ((E)3-methylbutan-2-one $\boldsymbol{O}$-methyl oxime): ${ }^{1} \mathrm{H}$ NMR ( 400 MHz , CHLOROFORM-D) $\delta 3.8(\mathrm{~s}, 3 \mathrm{H}), 2.55-2.37(\mathrm{~m}, 1 \mathrm{H}), 1.73(\mathrm{~s}, 3 \mathrm{H}), 1.04(\mathrm{~d}, \mathrm{~J}=6.9$, $\mathrm{Hz}, 6 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (101 MHz, CHLOROFORM-D) $\delta$ 162.0, 61.1, 34.3, 20.0, 10.8. EI-MS: $115\left(\mathrm{M}^{+}\right)$
(E)-3,3-dimethylbutan-2-one $\boldsymbol{O}$-methyl oxime (1d): colorless liquid

${ }^{1} \mathrm{H}$ NMR ( 400 MHz , CHLOROFORM-D) $\delta 3.81(\mathrm{~s}, 3 \mathrm{H}), 1.77(\mathrm{~s}, 3 \mathrm{H}), 1.10(\mathrm{~s}, 9 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (101 MHz, CHLOROFORM-D) $\delta 163.4,61.1,37.1,27.810 .5$.
EI-MS: $129\left(\mathrm{M}^{+}\right)$
(E)-pivalaldehyde $\boldsymbol{O}$-methyl oxime (1e): colorless liquid

${ }^{1} \mathrm{H}$ NMR (301 MHz, CHLOROFORM-D) $\delta 7.29(\mathrm{~s}, 1 \mathrm{H}), 3.80(\mathrm{~s}, 3 \mathrm{H}), 1.09(\mathrm{~s}, 9 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (76 MHz, CHLOROFORM-D) $\delta$ 158.3, 61.2, 33.6, 27.7
EI-MS: $115\left(\mathrm{M}^{+}\right)$

2,4-dimethylpentan-3-one $\boldsymbol{O}$-methyl oxime (1f): colorless liquid

${ }^{1} \mathrm{H}$ NMR ( 400 MHz, CHLOROFORM-D) $\delta 3.75(\mathrm{~s}, 3 \mathrm{H}), 2.98(\mathrm{~m}, 1 \mathrm{H}), 2.48(\mathrm{~m}, 1 \mathrm{H})$, $1.10(\mathrm{~d}, J=7.1 \mathrm{~Hz}, 6 \mathrm{H}), 1.07(\mathrm{~d}, J=6.9 \mathrm{~Hz}, 6 \mathrm{H}) .{ }^{13} \mathrm{C} \operatorname{NMR}(101 \mathrm{MHz}$, CHLOROFORM-D) $\delta 168.5,61.1,31.2,28.1,21.3,19.1$.
EI-MS: $143\left(\mathrm{M}^{+}\right)$

1-cyclohexylethanone $\boldsymbol{O}$-methyl oxime ( $\mathbf{1 g}$ ) : colorless liquid; obtained as a mixture of two isomers in a ratio $E / Z=10: 1$
 major isomer ( (E)-1-cyclohexylethanone O-methyl oxime ): ${ }^{1} \mathrm{H}$ NMR (301 MHz, CHLOROFORM-D) $\delta 3.77(\mathrm{~s}, 3 \mathrm{H}), 2.21-2.03(\mathrm{~m}, 1 \mathrm{H}), 1.77-1.62(\mathrm{~m}, 8 \mathrm{H})$, $1.31-1.14(\mathrm{~m}, 5 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( 76 MHz , CHLOROFORM-D) $\delta$ 161.4, 61.0, 44.5, 30.2, 26.1, 11.6. EI-MS: $155\left(\mathrm{M}^{+}\right)$
(R,E)-5-isopropyl-2-methylcyclohex-2-enone $\boldsymbol{O}$-methyl oxime ( $\mathbf{1 j} \mathbf{j}$ ): colorless liquid

${ }^{a} 5 \mathrm{~mol} \%$ of $\mathrm{Pd}(\mathrm{OPiv})_{2}{ }^{[11]}$ was employed catalyst instead of $\mathrm{Pd}(\mathrm{OAc})_{2}$

## IV. Experimental Procedure for the $\mathbf{s p}^{\mathbf{3}} \mathbf{C}-\mathbf{H}$ Arylation

## 1. General Procedure for the Pd-Catalyzed Arylation of Oximes.

Diaryliodonium salts $(0.25 \mathrm{mmol}), \mathrm{Pd}(\mathrm{OAc})_{2}(0.0125 \mathrm{mmol}, 2.8 \mathrm{mg})$ along with $\mathrm{Ag}_{2} \mathrm{CO}_{3}$ ( $0.5 \mathrm{mmol}, 137.9 \mathrm{mg}$ ) were placed in a schlenk tube. The tube was evacuated and recharged with $\mathrm{N}_{2}$ for 3 times. Mixing solvent of DCE $(1.5 \mathrm{ml})$ and HFIP $(0.5 \mathrm{ml})$ was dropped in under $\mathrm{N}_{2}$ atmosphere. Then appropriate ketoximes ( 0.25 mmol ) and PivOH ( $0.15 \mathrm{mmol}, 16.9 \mu \mathrm{l}$ ) was slowly added to the mixture. The tube was sealed and the mixture was allowed to stir at $70-90^{\circ} \mathrm{C}$ for 5 h . After completion which was monitored by GC/MS, the mixture was cooled to room temperature, then $\mathrm{NaHCO}_{3}$ aq. ( 5 mL ) was added. The mixture was extracted with ethyl acetate ( $5 \mathrm{~mL} \times 3$ ) and dried over anhydrous $\mathrm{MgSO}_{4}$. Evaporation of the solvent followed by purification on silica gel (petroleum ether/ethyl acetate $100 / 1$ to $50 / 1$ ) provided the corresponding ketoximes.
2. General Procedure for Obtaining Arylated Ketone and Aldehydes[

Diaryliodonium salts $(0.25 \mathrm{mmol}), \mathrm{Pd}(\mathrm{OAc})_{2}(0.0125 \mathrm{mmol}, 2.8 \mathrm{mg})$ and $\mathrm{Ag}_{2} \mathrm{CO}_{3}(0.5$ mmol, 137.9 mg ) were placed in a tube. The tube was evacuated and recharged with $\mathrm{N}_{2}$ for 3 times. Mixing solvent of DCE $(1.5 \mathrm{ml})$ and HFIP $(0.5 \mathrm{ml})$ was dropped in. Then appropriate ketoximes $(0.25 \mathrm{mmol})$ and $\mathrm{PivOH}(0.15 \mathrm{mmol}, 16.9 \mu \mathrm{l})$ was slowly added to the mixture. The tube was sealed and the mixture was allowed to stir at $70-90^{\circ} \mathrm{C}$ for 5 h . After completion, the mixture was filtered through celite and THF ( 2 ml ) was added in the filtrate. Then $35 \%$ aqueous formaldehyde solution ( 1 ml ) as well as $10 \%$ aqueous HCl solution $(0.5 \mathrm{ml}$ ) was added to the reaction mixture. Being stirred at $35^{\circ} \mathrm{C}$ for 5 h , the mixture was diluted with ethyl acetate $(10 \mathrm{~mL})$, neutralized with $\mathrm{NaHCO}_{3}$ aq. and washed with water $(10 \mathrm{~mL})$. The organic layer was dried over anhydrous $\mathrm{MgSO}_{4}$. Evaporation of the solvent followed by purification on silica gel (petroleum ether/ethyl acetate $100 / 1$ to $50 / 1$ ) provided the corresponding ketones.

## 3. Spectroscopic Data of Corresponding Products

## V. Experimental Procedure of hydrogenation

(E)-2-benzylcyclohexanone $O$-methyl oxime, $\mathbf{3 a a}$ ( $108.3 \mathrm{mg}, 0.5 \mathrm{mmol}$ ) in acetic acid ( 5 mL ) was hydrogenated over platinum(IV) oxide ( $11.3 \mathrm{mg}, 0.05 \mathrm{mmol}$ ) under hydrogen pressure ( 5 bar) for 24 h . Then, the mixture filtered through celite and washed between dichloromethane and aqueous $\mathrm{Na}_{2} \mathrm{CO}_{3}$ solution. The organic layer was concentrated purified on silica gel (petroleum ether/ethyl acetate $100 / 1$ ) to give provide $\mathbf{3 a a}-\mathbf{H}(78.8 \mathrm{mg}, 0.36 \mathrm{mmol}$, $72 \%$ ) as a colorless liquid.

N-(2-benzylcyclohexyl)-O-methylhydroxylamine (3aa-H): colorless liquid; Yield: 72\%

${ }^{1}$ H NMR ( 400 MHz , CHLOROFORM-D) $\delta 7.29-7.24$ (m, 2H), $7.21-$
7.15 (m, 3H), $3.56(\mathrm{~s}, 3 \mathrm{H}), 3.10(\mathrm{dt}, J=7.1,3.4 \mathrm{~Hz}, 1 \mathrm{H}), 2.79(\mathrm{dd}, J=13.5$, $5.5 \mathrm{~Hz}, 1 \mathrm{H}), 2.49(\mathrm{dd}, J=13.4,9.9 \mathrm{~Hz}, 1 \mathrm{H}), 2.08-1.93(\mathrm{~m}, 1 \mathrm{H}), 1.74-$
$1.64(\mathrm{~m}, 2 \mathrm{H}), 1.62-1.57(\mathrm{~m}, 1 \mathrm{H}), 1.44-1.23(\mathrm{~m}, 6 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( 101 MHz, CHLOROFORM-D) $\delta 141.6,129.2,128.3,125.8,62.2,59.5,40.3$, 35.7, 27.1, 23.5, 22.6.IR (neat, $v_{\text {N-H, }} v_{\mathrm{C}-\mathrm{N}}$ ) 2928, $1452 \mathrm{~cm}^{-1}$, EI-MS: $219\left(\mathrm{M}^{+}\right)$, HRMS (ESI, m/z) calcd for $\mathrm{C}_{14} \mathrm{H}_{21} \mathrm{NO}[\mathrm{M}+\mathrm{H}]^{+}: 220.1695$, found: 220.1690 .

## VI. Palladium Complex ${ }^{[7]}$

A schlenk tube was charged with $\operatorname{Pd}(\mathrm{OAc})_{2}(157 \mathrm{mg}, 0.7 \mathrm{mmol})$ and a solution of (E)-3,3-dimethylbutan-2-one O-methyl oxime ( $64.5 \mathrm{mg}, 0.5 \mathrm{mmol}$ ) in dichloroethane ( 1.5 mL ) and HFIP $(0.5 \mathrm{~mL})$. The tube was sealed and stirrd at $85^{\circ} \mathrm{C}$ for 4 h . After this time the reaction mixture was cooled to room temperature and treated with triphenylphosphine ( $466 \mathrm{mg}, 0.7$ $\mathrm{mmol})$. The tube was sealed $80^{\circ} \mathrm{C}$ for another 2 hours. After this time the reaction mixture was cooled to room temperature and filtered through a thin pad of Celite, eluting with ethyl acetate ( 30 mL ) and $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10 \mathrm{~mL})$ and the filtrate was concentrated under reduced pressure. The residue was then re-dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(20 \mathrm{~mL})$, washed with brine ( $2 \times 20 \mathrm{~mL}$ ) and dried over $\mathrm{Mg}_{2} \mathrm{SO}_{4}$ and concentrated under vacuum. The crude reaction mixture was purified by flash column chromatography (silica gel, gradient elution: $0 \%$ acetone in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ to $2.5 \%$ acetone in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ) to provide the complex as a colorless solid ( $236 \mathrm{mg}, 89 \%$ ). Crystals were grown by vial-in-vial diffusion of ether into dichloromethane solution of the title complex.

NMR: ${ }^{1}{ }^{H}$ NMR ( 400 MHz , CHLOROFORM-D) $\delta 7.78$ - 7.67 (m, 6H), $7.47-7.34$ (m, 9H), 4.15 (s, 3 H ), $1.95(\mathrm{~s}, 3 \mathrm{H}), 1.51(\mathrm{~d}, J=3.8 \mathrm{~Hz}, 2 \mathrm{H}), 1.06(\mathrm{~s}, 6 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( 101 MHz , CHLOROFORM-D) $\delta$ 183.4, 134.7, 134.6, 131.8, 131.3, 130.3 128.3, 128.2, 62.8, 48.8, 46.1, 29.1, 27.0, 12.7

X-ray crystal structure analysis of compound 6: Single crystals suitable for X-ray analysis were obtained by slow evaporation of its solution in hexane. The crystal structure has been deposited at the Cambridge Crystallographic Data Centre and allocated the deposition number: CCDC 1048079. Formula: $\mathrm{C}_{15} \mathrm{H}_{29} \mathrm{ClNOPPd}, M=532.31$, colourless crystal, 0.33 x $0.21 \times 0.11 \mathrm{~mm}, a=16.151(3), b=9.5824(19), c=16.403(3) \AA, \alpha=90.00, \beta=111.38(3), \gamma=$ $90.00, V=2363.9(8) \AA^{3}, \rho_{\text {calc }}=1.496 \mathrm{gcm}^{-3}, \mu=0.982 \mathrm{~mm}^{-1}, Z=4$, Monoclinic, space group $\mathrm{P} 2(1) / \mathrm{n}, \lambda=0.71073 \AA, T=173(2) \mathrm{K}$. Data completeness $=0.985$, Theta $(\max )=25.00$

## VII. Discussions on Negative Results

## 1. Application of diaryliodonium salts bearing heteroaromatic rings

2m

2n

20

2p

When $\mathbf{2 m}$ was employed to react with $\mathbf{1 a}$, the transformation of phenyl group was observed to generate 3aa. As to $\mathbf{2 n}$, it is noted in the manuscript that asymmetric diaryliodonium salts $\mathrm{Ar}-\mathrm{I}^{+}-\mathrm{Mes} \mathrm{X}^{-}$are not applicable in this reaction. And for $\mathbf{2 o}$ and $\mathbf{2 p}$, no desired products were obtained probably due to the coordination of pyridine group with palladium catalysts.
2. Examination of aromatic oxime ether under the standard condition

Yield: 64\%
3. Results of the methylene $\mathbf{C - H}$ bond activation.

Listed above are the oximes we examined under the optimized condition of this method with diaryliodonium salts $\mathbf{2 d}$. $\mathbf{1 q} \mathbf{- 1} \mathbf{s}$ were not be able be arylated while the arylated product of 1t was observed with trace amounts in GC/MS. The scope of substrates is somehow limited for arylation on methylene C-H bond and it likely depends on the angle between the directing groups and aimed activated bonds. $\mathbf{1 g}$ and $\mathbf{1 h}$ can be arylated in only moderate yields since the convertion rate of starting materials were comparably low. We failed to further increase the yield by adding legands, additives, etc., while it helped a little by using more diaryliodonium salts as well as higher reacting temperature.
