## General Procedures

Unless otherwise stated, all reagents were purchased from commercial suppliers and used without further purification. Anhydrous solvents were used which were dried using the Anhydrous Engineering Ltd. double alumina and alumina-copper catalysed drying columns. All moisture or air sensitive reactions were carried out in flame dried glassware under a positive pressure of N2 using standard syringe/septa techniques. Flash column chromatography was performed on silica gel (Merck Kieselgel 60, 230-400 mesh). Thin layer chromatography was carried out on Polygram 0.2 mm silica gel TLC plates visualising with 254 nm UV light and developing with either a $\mathrm{KMnO}_{4}$, phosphomolybdic aicd or Vanillin dip, where appropriate. Optical rotations were determined with the sodium D line ( $\lambda=589 \mathrm{~nm}$ ) using a Perkin Elmer 241 MC polarimeter. $[\alpha]^{22}$ values are quoted in units $10^{-1} \mathrm{deg} \mathrm{cm}{ }^{2} \mathrm{~g}^{-1}$. Infrared (IR) spectroscopy was recorded on a Perkin Elmer Spectrum 100 FT-IR spectrometer with an ATR diamond cell irradiating between $4000 \mathrm{~cm}^{-1}$ and $600 \mathrm{~cm}^{-1}$. Melting points were determined using an electrothermal melting point apparatus and are uncorrected. Electron impact (EI) and chemical ionisation ( Cl ) mass spectra were recorded on a VG Analytical Autospec mass spectrometer. Methane was the ionization gas used for Cl . Electrospray ionisation (ESI) mass spectra were recorded on a Micromass LCT mass spectrometer or a VG Quattro mass spectrometer.

NMR spectra were recorded using either a Varian 400 MHz or JEOL ecp 400 MHz spectrometer. Chemical shifts $\left(\delta_{H}\right)$ are quoted in parts per million (ppm), $J$ values are given in Hz and referenced to the appropriate residual solvent peak. Data reported as follows: chemical shift, integration, multiplicity $(s=$ singlet, $b r s=$ broad singlet, $d=$ doublet, $t=$ triplet, $q=q u a r t e t, q i=$ quintet, $s x=$ sextet, hept $=$ heptet, $m=$ multiplet, $d d=$ doublet of doublet, etc.), coupling constants, assignment. Chemical shifts $\left(\delta_{C}\right)$ are quoted in parts per million (ppm), referenced to the appropriate residual solvent peak. DEPT ${ }^{135}$, COSY and HMQC were used for all new compounds in assigning NMR spectra. Chiral SFC was performed using Diacel Chiralpak IA, IB and IC columns ( $4.6 \times 250 \mathrm{~mm} \times 5 \mu \mathrm{~m}$ ) or a Whelk $0-1$ column ( $4.6 \times 250 \mathrm{~mm} \times 5 \mu \mathrm{~m}$ ) on a WatersTharSFC system and monitored by DAD (Diode Array Detector).

## Preparation of compounds

## Benzyl(1,3-dithiane)dimethylsilane 4

n-Butyllithium ( $14 \mathrm{~mL}, 1.57 \mathrm{M}$ solution in hexanes, 22.0 mmol ) was added dropwise to 1,3 dithiane ( $2.2 \mathrm{~g}, 18.3 \mathrm{mmol}$ ) in dry THF ( 60 mL ) at $-15{ }^{\circ} \mathrm{C}$ under $\mathrm{N}_{2}$. This was stirred for 6 h , warming to RT slowly. The solution was then added dropwise via cannula to a solution of benzyl(dimethyl)chlorosilane ( $3.7 \mathrm{~mL}, 20.2 \mathrm{mmol}$ ) in dry THF ( 30 mL ) at $0{ }^{\circ} \mathrm{C}$ and the reaction allowed to warm to RT and stirred for 14 h . A saturated solution of ammonium chloride ( 25 mL ) was added, the organic phase separated and aqueous layer extracted with EtOAc ( $3 \times 20 \mathrm{~mL}$ ). The combined organic phases were dried $\left(\mathrm{MgSO}_{4}\right)$ and concentrated in vacuo to yield a dark brown oil. This was purified by column chromatography (Pet: EtOAc, 99:1) to afford a brown oil. Further purification by bulb to bulb distillation gave thioacetal 4 as a colourless oil ( $4.4 \mathrm{~g}, 89 \%$ ); bp $235{ }^{\circ} \mathrm{C}$ at $8.0 \mathrm{mbar} ; \mathrm{v}_{\text {max }}(\mathrm{neat}) / \mathrm{cm}^{-1} 3059(\mathrm{ArCH}), 2953(\mathrm{CH}), 1599(\mathrm{ArC=C}) ; \delta_{\mathrm{H}}(400 \mathrm{MHz}$; $\left.\mathrm{CDCl}_{3}\right) 0.14\left(6 \mathrm{H}, \mathrm{s}, 2 \times \mathrm{SiCH}_{3}\right), 1.99-2.18\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 2.27\left(2 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2} \mathrm{Ph}\right), 2.29(2 \mathrm{H}, \mathrm{dt}, \mathrm{J} 14.3,3.2$, $\mathrm{SCH}_{2}$ ), $2.78\left(2 \mathrm{H}, \mathrm{td}, \mathrm{J} 14.3,2.9, \mathrm{SCH}_{2}\right), 3.72(1 \mathrm{H}, \mathrm{s}, \mathrm{SCH}), 7.08-7.15(3 \mathrm{H}, \mathrm{m}, \mathrm{ArH}), 7.23-7.25(2 \mathrm{H}, \mathrm{m}$, $\mathrm{ArH}) ; \delta_{\mathrm{C}}\left(100 \mathrm{MHz} ; \mathrm{CDCl}_{3}\right)-5.2\left(2 \times \mathrm{SiCH}{ }_{3}\right), 23.1\left(\mathrm{CH}_{2} \mathrm{Ph}\right), 26.2\left(\mathrm{CH}_{2}\right), 31.0\left(2 \times \mathrm{SCH}_{2}\right), 32.9(\mathrm{CH})$, 124.3 (C-Ar), 128.1 (C-Ar), 128.3 (C-Ar), 138.9 (C-Ar); m/z (ESI) 291.0679 ( $\mathrm{MNa}^{+}, 100 \%$, $\mathrm{C}_{13} \mathrm{H}_{20} \mathrm{NaS}_{2} \mathrm{Si}$ requires 291.0668).

## General procedure for the oxidation of 1-silyl tetrahydropyrans

TBAF (1.5 eq, 0.25 M solution in THF) was added dropwise over 30 minutes to a solution of 1silyl tetrahydropyran ( $0.1 \mathrm{mmol}, 1 \mathrm{eq}$ ) in dry $\mathrm{THF}(1.5 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$ under $\mathrm{N}_{2}$. Upon warming slowly to $15{ }^{\circ} \mathrm{C}$, disappearance of 1-silyl tetrahydropyran was monitored by TLC. Urea hydrogen peroxide ( 5 eq ), potassium hydrogen carbonate ( 3 eq ) and dry methanol ( 0.25 mL ) were added. This was left to warm to RT for 1 hour, monitored by TLC using phosphomolybdic acid staining, with the lactol visualized as a green spot. On completion aqueous saturated sodium thiosulfate solution ( 2 mL ) was added, the organic phases separated and aqueous layer extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 5 \mathrm{~mL})$. The crude reaction mixture was concentrated in vacuo then taken up in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(1.5 \mathrm{~mL})$. The solution was then cooled to $0^{\circ} \mathrm{C}$ and triethylamine ( 5 eq ), acetic anhydride (3 eq) and a crystal of DMAP was added. The reaction was stirred for 1 h and on completion water ( 6 mL ) was added and the organic phase separated. The aqueous phase was washed with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 6 \mathrm{~mL})$, the combined organic phases dried $\left(\mathrm{MgSO}_{4}\right)$ and concentrated in vacuo. The residue was then purified by column chromatography (Pet:EtOAc) to yield 1-O-acetates as a mixture of $\alpha / \beta$ anomers, inseparable by column chromatography. Selected data is reported below.
