I. Materials and methods

All reactions and manipulations were carried out under an atmosphere of dry argon using standard Schlenk techniques. Dry, oxygen-free solvents were employed. All organic reagents were obtained from commercial sources and dried overnight with P_2O_5 before use. Substrates **1c-f** and Catalyst **I** were prepared following the literature procedures.^{51,31P, 1H and 13C} spectra were recorded on Bruker Avance 300 and 500. ^{31P, 1H and 13C} chemical shifts are expressed with a positive sign, in parts per million, relative to external 85% H_3PO_4 and Me_4Si . Unless otherwise stated, NMR spectra were recorded at 293 K. IR spectra were recorded on Thermoscientific FTIR 6700 equipped with a DLaGS detector using a CaF_2 cell.

II. Kinetic studies

II.a. General sampling procedure

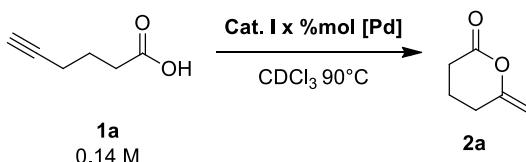

All the kinetic studies were set up under Argon atmosphere. 0.7 mL of deuterated chloroform as solvent was used for all experiments. At every sampling time, a ^{1H} NMR spectra was recorded and the conversion was determined related to the integration of the alkyne proton of the substrate ($\delta = 1.99$ ppm) and the methylene protons of the lactone ($\delta = 4.30$ ppm).

II.b. Partial order determination:

The partial order of each reaction's components (substrate and catalyst) was determined by the initial rate method. The data of the concentration of product versus time plot were fitted with Excel. The obtained slope of the linear fitting represents the initial rate. The partial order was then determined by plotting the initial rates versus the initial concentrations.

II.b.1. Partial order determination for [Pd]

To determine the partial order of the reaction on catalyst, the initial kinetic profiles at different initial concentrations of palladium center were recorded. The final data were obtained by averaging the results of three independent trials for each experiment.

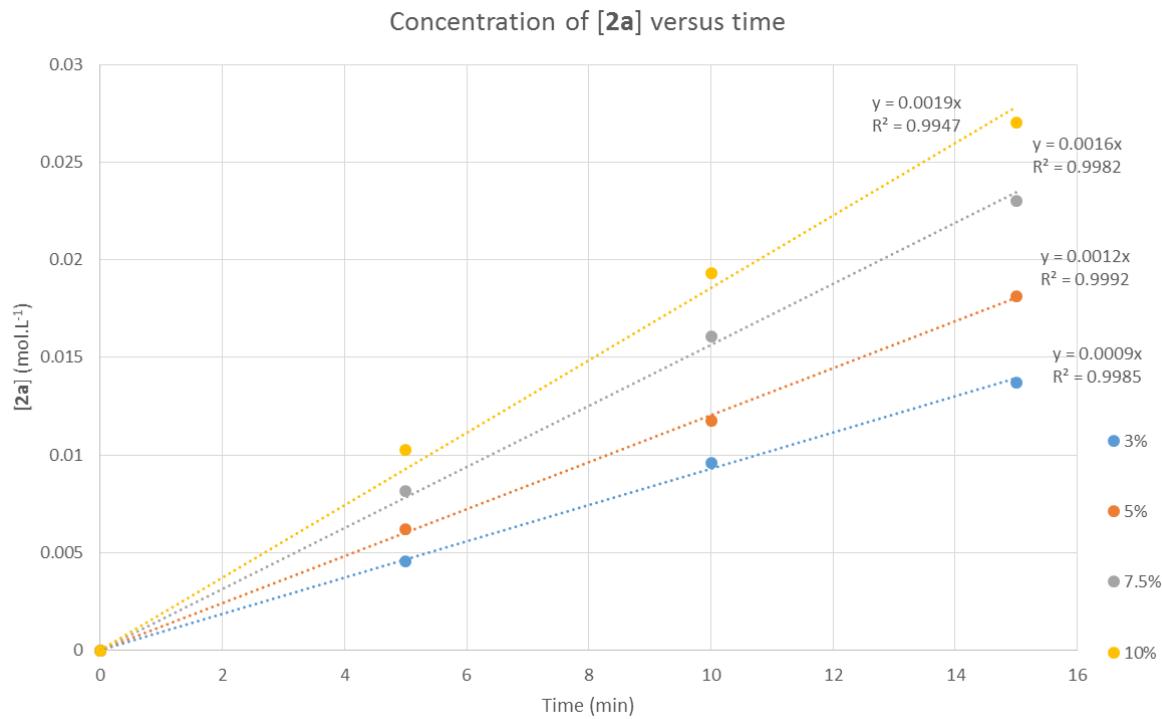

Experiment	% mol [Pd]	x mg of Cat. I	Initial concentration [Pd]
1	3	1.5	0.0042
2	5	2.5	0.007
3	7.5	3.8	0.0105
4	10	5.1	0.014

Figure S1. Reaction conditions for the partial order determination of [Pd].

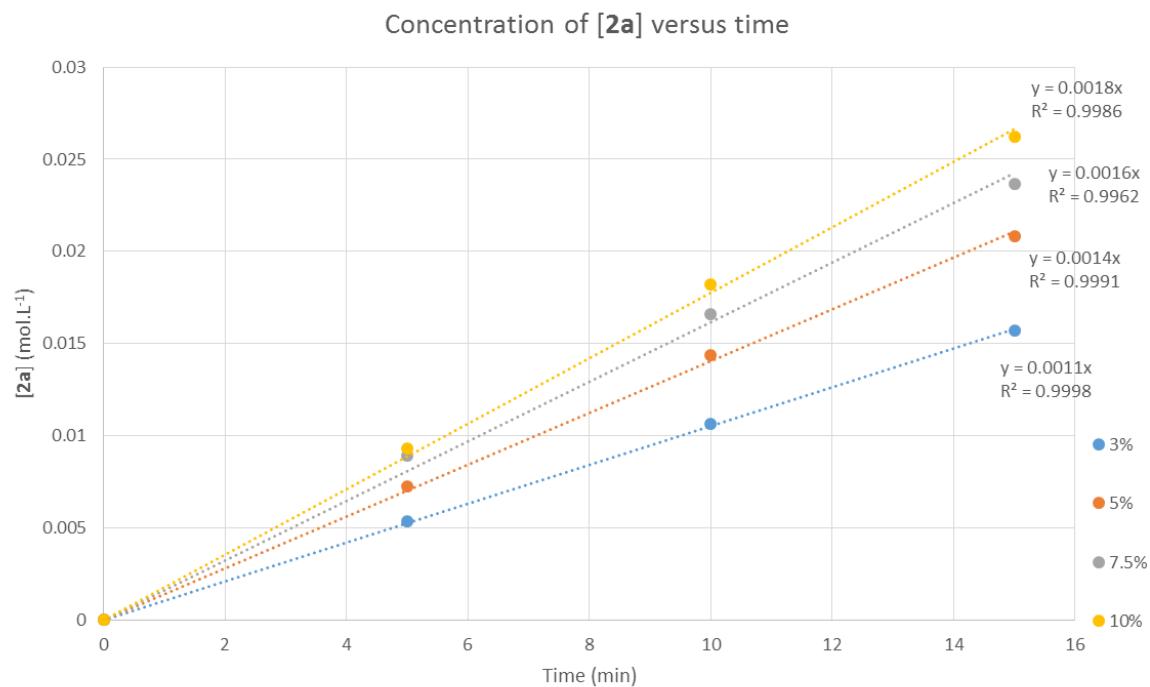

General procedure: 10.8 μL of 5-hexynoic acid **1a** (0.0098 mmol, 0.14 M) a specific quantity of Catalyst **I** according to the above table and 0.7 mL of $CDCl_3$ were introduced in a pressure NMR tube. The

reaction mixture was heated at 90°C and ^1H NMR spectra were recorded every five minutes until a conversion of 10%.

III. Study of the self association 5-hexynoic acid in CHCl_3 by IR spectroscopy.

The self-association of 5-hexynoic acid was evidenced by IR spectroscopy in CHCl_3 at different acid concentrations (*Vide Infra*). IR spectra were recorded with a resolution of 4 cm^{-1} in 16 scans. Two well defined absorptions bands were observed, at 1711 and 1751 cm^{-1} corresponding to the dimeric and monomer forms, respectively. The observed bands are shown in Figure S23 at different concentrations and reported in Table S8 with the intensities ratio.

VI. ^{31}P NMR analysis of the Palladium indenediide dimer I at variable temperature.

The dissociation-association behavior of the Palladium indenediide dimer I was evidenced by ^{31}P NMR spectroscopy at variable temperature using a 400 MHz NMR spectrometer. The association activation barrier was estimated from these experiments (Figure S24), using the following formula:

$$\Delta G^\# = RT_c \ln \left(\frac{RT_c \sqrt{2}}{\pi N_A h |\nu_A - \nu_B|} \right)$$

The association activation barrier was estimated to be at least of 15.8 kcal.mol⁻¹, considering the ^{31}P NMR spectroscopic data: the coalescence temperature $T_c = 363$ K, and the chemical-shift difference $|\nu_A - \nu_B| = 1017.33$ Hz.

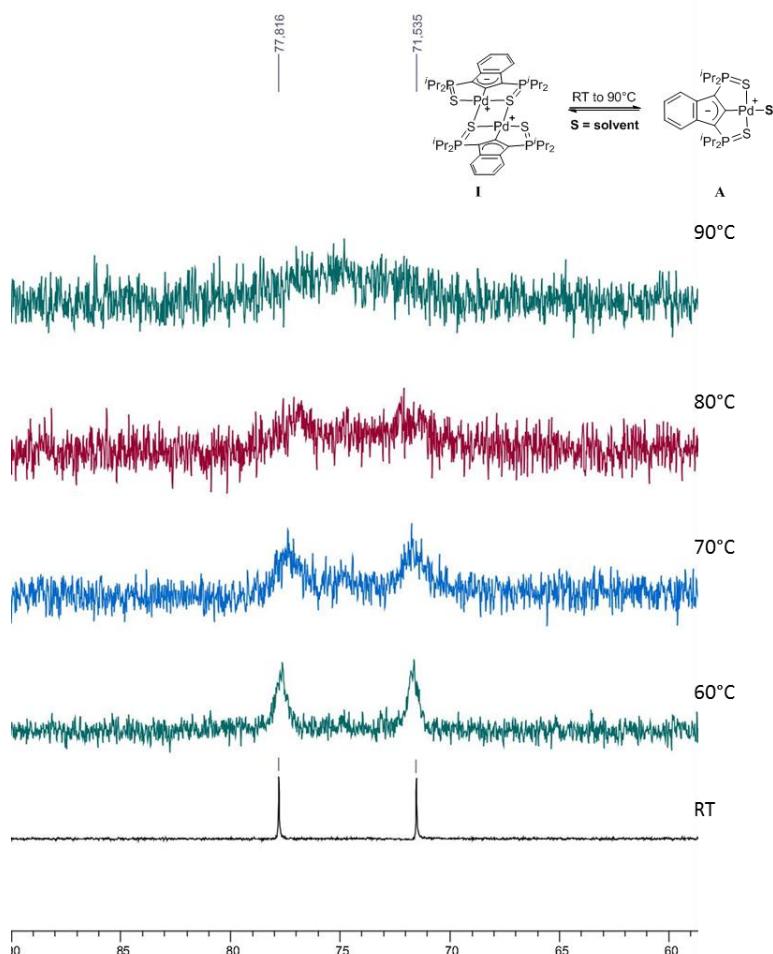

Figure S24. ^{31}P NMR analysis of Palladium indenediide dimer **I** at variable temperature in CDCl_3 , carried out at $1.4 \times 10^{-2} \text{ mol.L}^{-1}$.

VII. General procedure for cycloisomerization of alkynoic acids in presence of additives:

In a NMR pressure tube, alkynoic acid (0.098 mmol), dried additive (x mol%) and complex **I** (2.5 mg, 5 mol% [Pd]) in 0.7 mL of CDCl_3 were heated at the corresponding temperature under argon atmosphere. The progress of the reaction was monitored by ^1H NMR.

8	4-Nitrocatechol 4x	0.2	1	90	92% ^c

(a) Catalytic reactions performed under argon during 30 min using 0.1 mmol of 5-hexynoic acid (0.14 M in CDCl_3) and 5 mol% [Pd] with dimer I. (b) Conversion were determined by ^1H NMR analysis. (c) Reaction time of 36h.

VIII. Characterization of product **2f**:

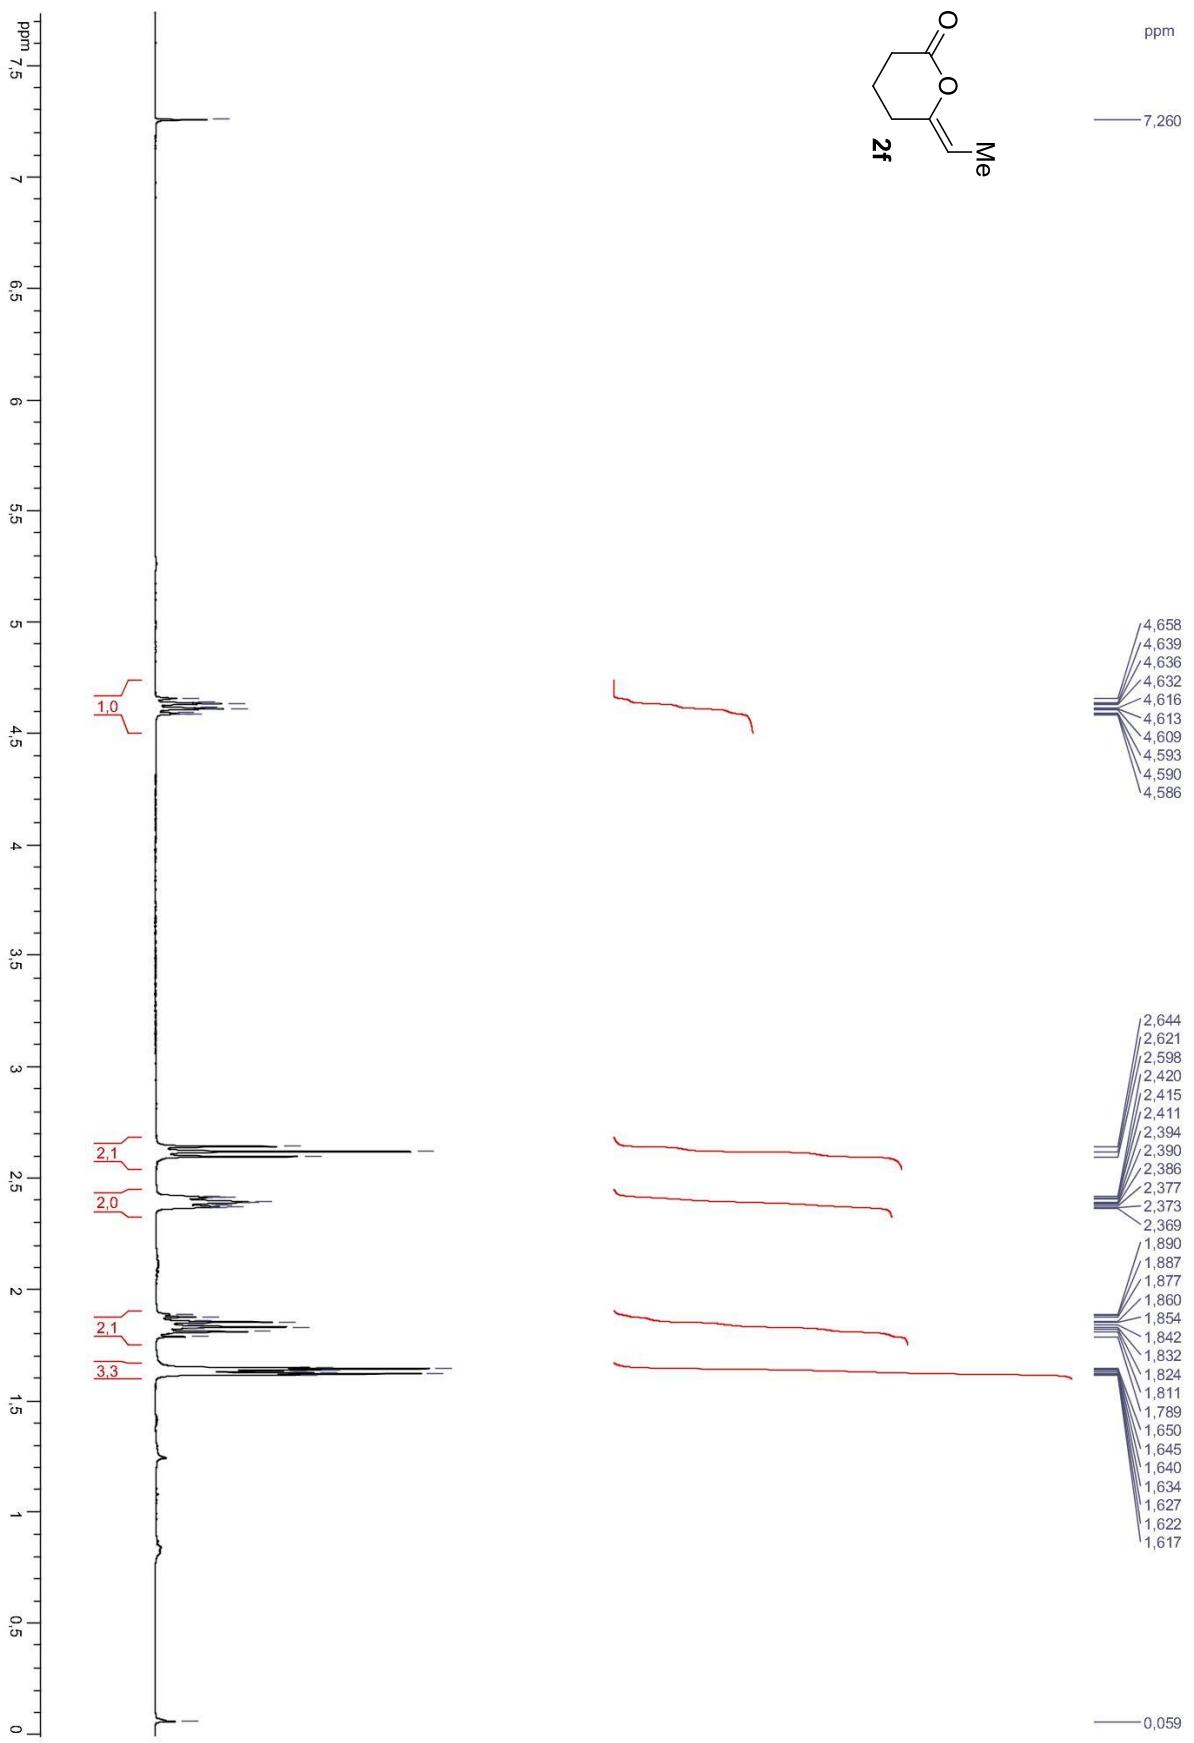

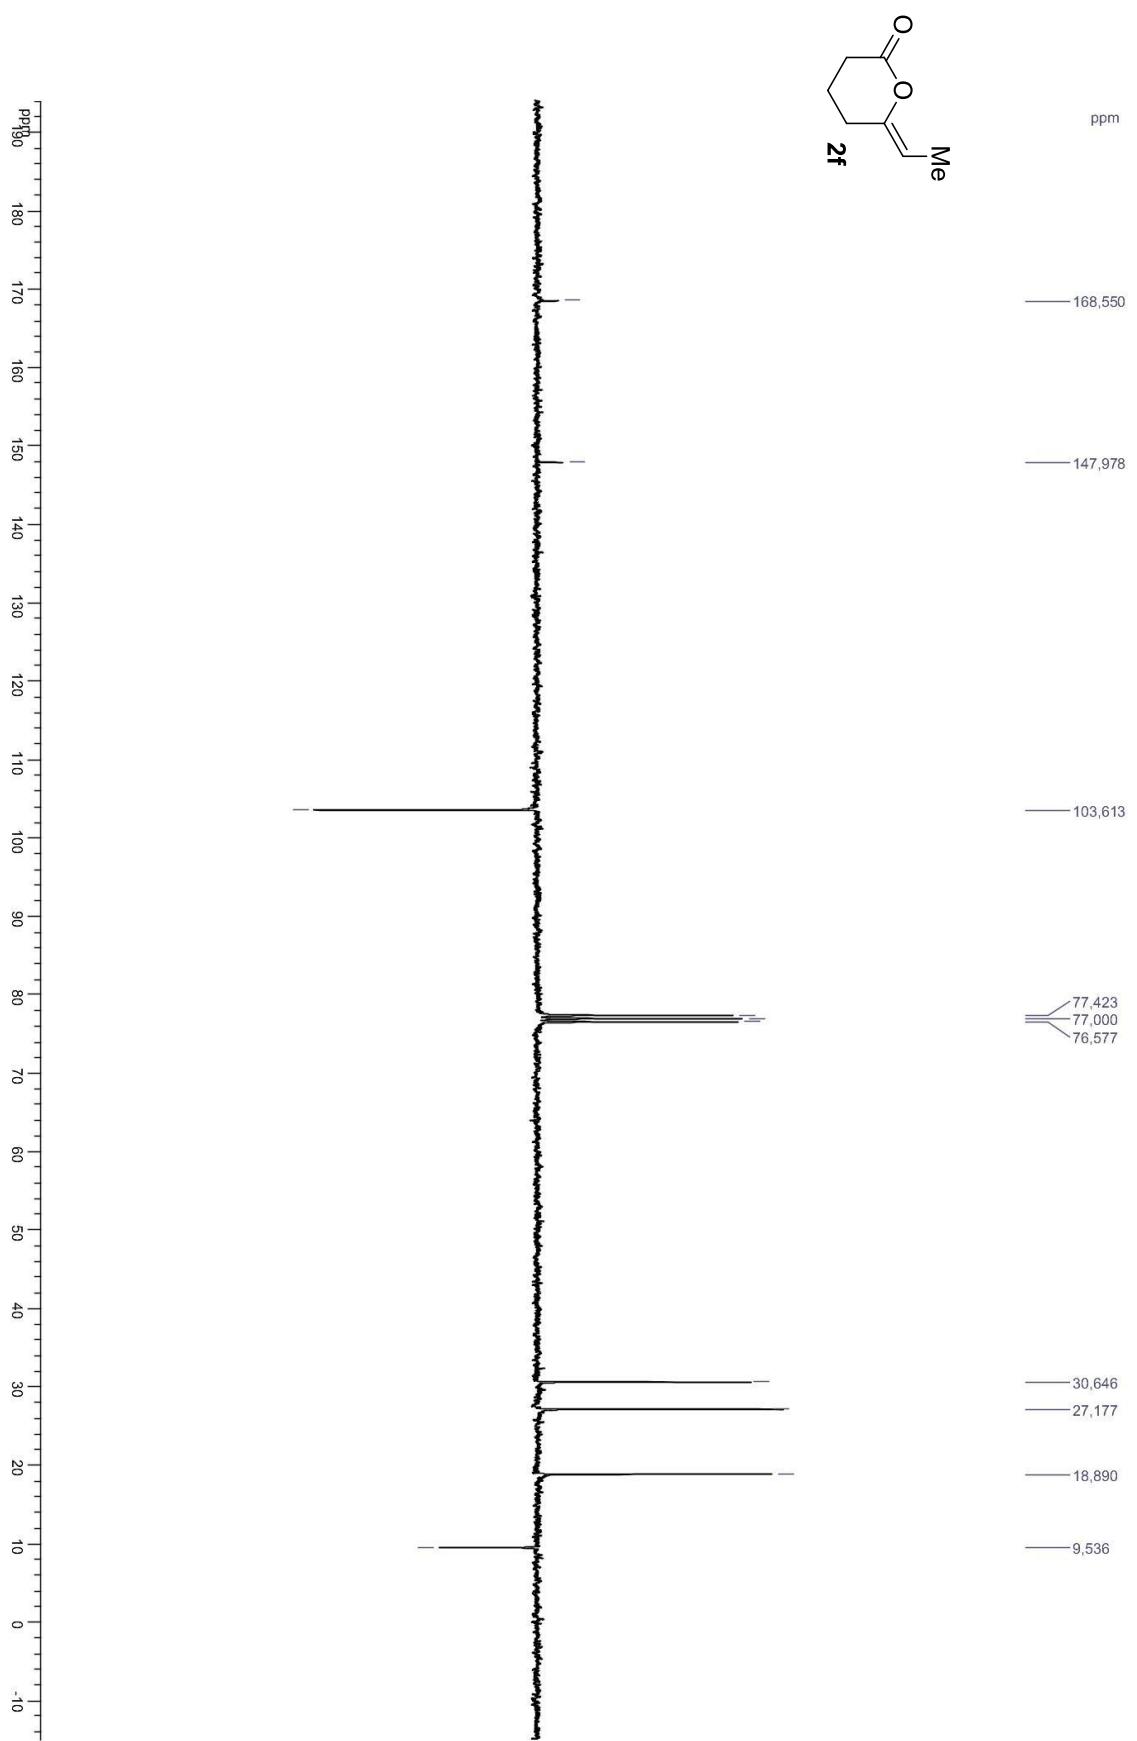

Product **2f** was obtained following the general procedure at 90°C in 60 h. Under these conditions, hydration of the alkyne moiety was observed. The residue was purified by flash chromatography. The high volatility of compound **2f** prevented accurate determination of isolated yield. A NMR yield of 70% was determined using mesitylene as internal standard. The NMR signals corresponding to the hydration product **2f'** in the crude are in total agreement with the reported characterization.^{S2}

IX. Computational details

Calculations were carried out with the Gaussian 09 program^{S3} on the real experimental palladium-pincer system at the B3PW91 level of theory.^{S4} Palladium atom was treated with the corresponding Stuttgart-Dresden RECP (relativistic effective core potential) in combination with its adapted basis set,^{S5} augmented by an extra set of a *f* polarization function.^{S6} Phosphorus atoms were represented by the ECP from Dolg *et al.* and its associated basis set,^{S7} augmented also by *d* polarization functions.^{S8} For the remaining atoms the 6-31G(d,p) basis set was used.^{S9} Geometry optimizations carried out without any symmetry restrictions, and were followed by analytical frequency calculations to confirm that a minimum or a transition state had been reached. The connection between the transition state and the corresponding minima were done by performing IRC calculations.^{S10} Finally, the CYLview program was used for the representation of 3D structures.^{S11}
