I. Materials and Methods

All commercial materials (Alfa Aesar, Aladdin, J&K Chemical LTD.) were used without further purification. All solvents were analytical grade. The ^1H -NMR and ^{13}C - NMR spectra were recorded on a Bruker 400 MHz spectrometer in CD_3OD , DMSO-d_6 or CDCl_3 using TMS or solvent peak as a standard. All ^{13}C -NMR spectra were recorded with complete proton decoupling. Low-resolution mass spectral analyses were performed with a Waters AQUITY UPLCTM/MS. All reactions were carried out in oven-dried sealed tube. Analytical TLC was performed on Yantai Chemical Industry Research Institute silica gel 60 F254 plates and flash column chromatography was performed on Qingdao Haiyang Chemical Co. Ltd silica gel 60 (200-300 mesh). The rotavapor was BUCHI's Rotavapor R-3.

II. Density functional theory (DFT) calculation

1,computational details:

All the calculations were carried out with the Gaussian 09 package.¹ Geometry optimizations were performed with B3LYP². LANL2DZ+f (1.472 for Pd) basis set³ with effective core potential (ECP) was used for metal centers, and the 6-31G (d) basis set⁴ was used for other atoms. Frequency was calculated at the same level of theory to obtain zero-point energy (ZPE) corrections and to verify the stationary points to be minima. Because the M06⁵ functional includes noncovalent interactions and gives refined energies for organo transition metal systems, single-point energies were conducted by using M06/SDD⁶-6-311++G(d,p)⁷. Solvation effects were evaluated with SMD solvation model.⁸ Acetic acid was chosen as the solvent. The relative energies with ZPE corrections and free energies (at 298.15K) are in kcal/mol.

II. Directing groups synthesis and screening

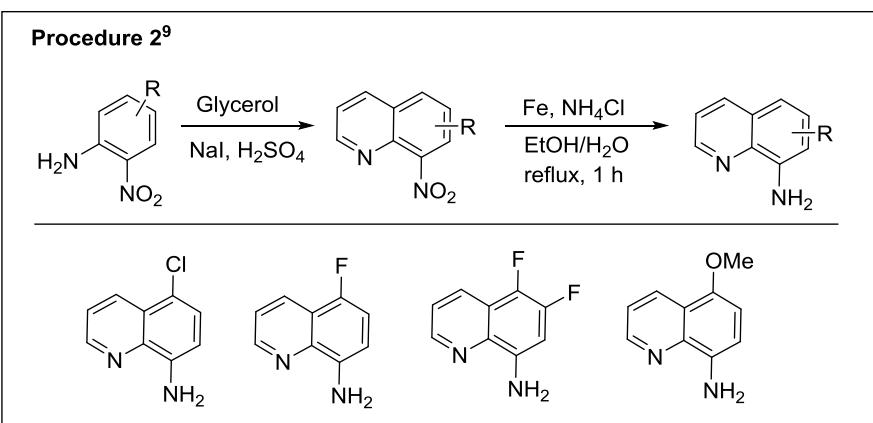

a) Different directing groups were synthesized by following procedures.

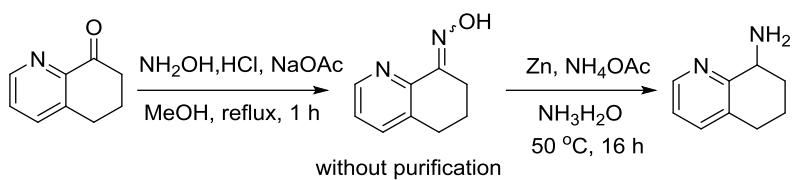

Example

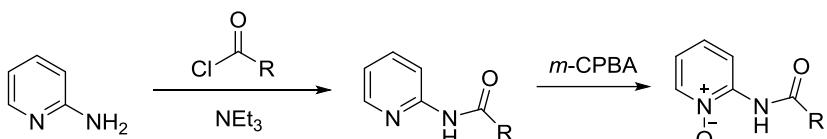

To a 10 mL sealed tube were added N-(quinolin-8-yl)isobutyramide (214 mg, 1.0 mmol), NCS (267 mg, 2.0 mmol) and CH₃CN (4 mL). The tube was sealed and heated at 120 °C for 12 h. The reaction mixture was cooled to RT, H₂O was added to dilute the reaction mixture. Then reaction mixture was extracted by DCM for three times, the organic layer dried over anhydrous Na₂SO₄ and concentrated on rotavapor under reduced pressure. Finally, the residue was purified by silica gel column chromatography (Petroleum ether:Ethylacetate = 2:1) to give the desired product.

IV. Substrates preparation

General procedure 1

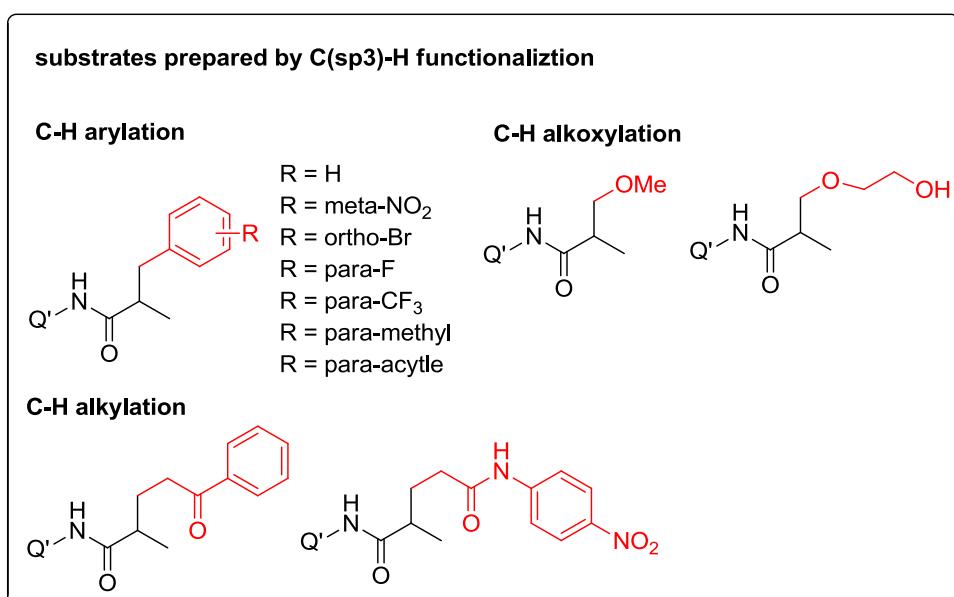

To a solution of the acid in DCM, 1.3 equiv. of oxalyl chloride and 1-2 drops of DMF were added. The mixture was allowed to stir at rt for 5 h. Then the mixture was concentrated to remove the solvent and excess oxalyl chloride to afford the crude acyl chloride, which was subsequently dissolved in DCM followed by addition of 1.0 equiv of directing group and 2.0 equiv of Et₃N in ice-water bath. The mixture was stirred for 5 h (monitored by TLC). Then water was added to quench the reaction. The reaction mixture was extracted with DCM for 3 times. The combined organic layer was dried over Na₂SO₄. After filtration and concentration, the residue was purified by column chromatography to afford the pure compound, which was confirmed by NMR and LC-MS analysis.

General procedure 2

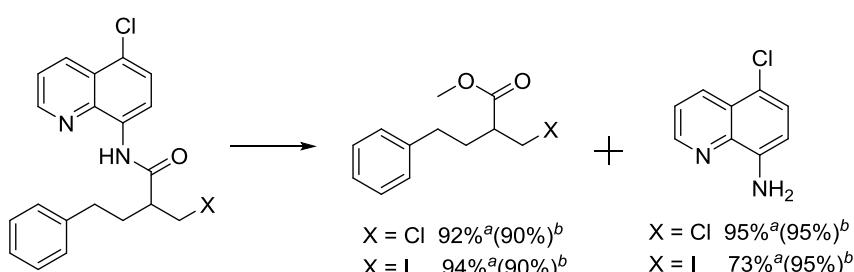

Referring to recent published papers¹², Pd-catalyzed C(sp³)-H functionalization methods were applied with isobutyric acid derivative as substrate.
