Experimental section: materials and physical measurements, X-ray structure determination and synthesis.
Figure S1. Experimental and simulated powder X-ray diffraction (PXRD) patterns.
Figure S2. The dc field dependence of the relaxation time at 1.8 K .
Figure S3. The plots of the relaxation time $\tau v s . T$ on a log-log scale.
Figure S4. The plots of the relaxation time $\tau v s . T$ with consideration of the direct and Raman processes.
Figure S5. The plots of the relaxation time $\tau v s . T$ with consideration of the direct, Raman, and Obach processes.
Table S1. Crystallographic Data and Structural Refinements.
Table S2. Selected bond lengths $(\AA)$ and bond angles $\left({ }^{\circ}\right)$ for $\mathbf{1}$.
Table S3. Selected bond lengths $(\AA)$ and bond angles $\left({ }^{\circ}\right)$ for $\mathbf{2}$.
Table S4. Lanthanide geometry analysis by using Continuous Shape Measurements (CShM).
Table S5. Energy levels and eigenstates extracted from the $\chi_{\mathrm{m}} T-T$ and $M-H$ data.

## EXPERIMENTAL SECTION

Materials and Physical Measurements. The ligand was synthesized as literature described. ${ }^{1}$ Metal salts and other reagents were commercially available and used as received without further purification. The $\mathrm{C}, \mathrm{H}, \mathrm{N}$ and S microanalyses were carried out with an Elementar Vario-EL CHNS elemental analyzer. X-ray powder diffraction (XRPD) intensities for polycrystalline samples were measured at 293 K on Bruker D8 Advance Diffratometer (Cu- $\mathrm{K}_{\alpha}, \lambda$ $=1.54056 \AA$ ) by scanning over the range of $5-50^{\circ}$ with step of $0.2^{\circ} / \mathrm{s}$. Calculated patterns were generated with Mercury. The luminescence spectra were measured using an Edinburgh Instrument FLS980 Combined Fluorescence Lifetime and Steady State Spectrometer. The steady-state luminescence was excited by unpolarized light from a 450 W xenon CW lamp at 298 K and 15 K . The lifetime measurements were excited by a pulsed $\mu \mathrm{s}$ flash lamp at 298 K . Magnetic susceptibility measurements were performed with a Quantum Design MPMS-XL7 SQUID. Polycrystalline samples were embedded in vaseline to prevent torquing. Data were corrected for the diamagnetic contribution calculated from Pascal constants.

X-ray Structure Determination. Diffraction intensities were collected on a Rigaku R-AXIS SPIDER IP diffractometer with Mo K $\alpha$ radiation $(\lambda=0.71073 \AA$ ) for complexes 1 and 2 at $150(2) \mathrm{K}$. The structures were solved by direct methods, and all non-hydrogen atoms were refined anisotropically by least-squares on $F^{2}$ using the SHELXTL program suite. ${ }^{2}$ Anisotropic thermal parameters were assigned to all non-hydrogen atoms. The hydrogen atoms attached to carbon, nitrogen and oxygen atoms were placed in idealised positions and refined using a riding model to the atom to which they were attached. The disordered solvent molecules were squeezed ${ }^{3}$ and reconfirmed by the elemental analysis. CCDC 1426946 (1) and 1426947 (2) contain the supplementary crystallographic data for this paper. These data can be obtained free of charge via www.ccdc.cam.ac.uk/conts/retrieving.html.

Synthesis. $\mathrm{Dy}\left(\mathbf{N}_{5}\right)_{2}\left(\mathrm{CF}_{3} \mathrm{SO}_{3}\right)_{3}$ (1): A mixture of 2,6-diacetyl pyridine ( 0.10 mmol ) and 2-diazanyl pyridine ( 0.20 mmol ) was dissolved in 6 mL acetonitrile. Under stirring, the solution was turned yellow. After 30 minutes, $\mathrm{Dy}\left(\mathrm{CF}_{3} \mathrm{SO}_{3}\right)_{3}(0.05 \mathrm{mmol})$ was added and the mixture was stirred for 30 minutes. Yellow crystals suitable for X-ray analysis were obtained in several days by slow diffusion of diethyl ether into the solution above. Elemental analysis (\%) for $\mathrm{C}_{41} \mathrm{H}_{38} \mathrm{DyF}_{9} \mathrm{~N}_{14} \mathrm{O}_{9} \mathrm{~S}_{3}$, calcd, $\mathrm{C}: 37.87, \mathrm{H}: 2.95, \mathrm{~N}: 15.08, \mathrm{~S}: 7.40$; found, $\mathrm{C}: 37.77, \mathrm{H}: 3.02, \mathrm{~N}: 15.22, \mathrm{~S}: 7.37$.
$\mathrm{Dy}\left(\mathbf{N}_{5}\right)_{2}\left(\mathrm{CF}_{3} \mathrm{SO}_{3}\right)_{3}(\mathbf{2})$ : the procedure was the same as that employed for complex 1, except that pyridine was replaced by metal salts. The yellow crystals were obtained by slow diffusion of diethyl ether into the solution. Elemental analysis (\%) for $\mathrm{C}_{41} \mathrm{H}_{38} \mathrm{ErF}_{9} \mathrm{~N}_{14} \mathrm{O}_{9} \mathrm{~S}_{3}$, calcd, C: 37.73, H: 2.93, $\mathrm{N}: 15.02, \mathrm{~S}: 7.37$; found, C:38.16, H: 3.10, N: 15.34; S: 7.22.
