**General remarks:**  $^1\text{H}$  NMR spectra were recorded on a Bruker AM-300 or AM-400 spectrometer for solution in  $\text{CDCl}_3$  with tetramethylsilane (TMS) as internal standard; J-values are in Hz. High resolution mass spectra were obtained by using Agilent Technologies 6224 TOF LC/MS (ESI). All of the compounds reported in this paper gave satisfactory HRMS analytic data. Melting points were obtained with a Yanagimoto micro melting point apparatus and are uncorrected. Infrared spectra were recorded on a Perkin-Elmer PE-983 spectrometer with absorption in  $\text{cm}^{-1}$ . THF, toluene and  $\text{Et}_2\text{O}$  were distilled from sodium (Na) under argon (Ar) atmosphere.  $\text{CH}_3\text{CN}$ , 1, 2-dichloroethane and dichloromethane were distilled from  $\text{CaH}_2$  under argon (Ar) atmosphere. Commercially obtained reagents were used without further purification. All reactions were monitored by TLC with Huanghai GF254 silica gel coated plates. Flash column chromatography was carried out using 300-400 mesh silica gel at increased pressure.

## General procedures and spectroscopic data of compounds **1** and **1'**

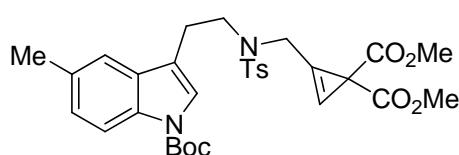

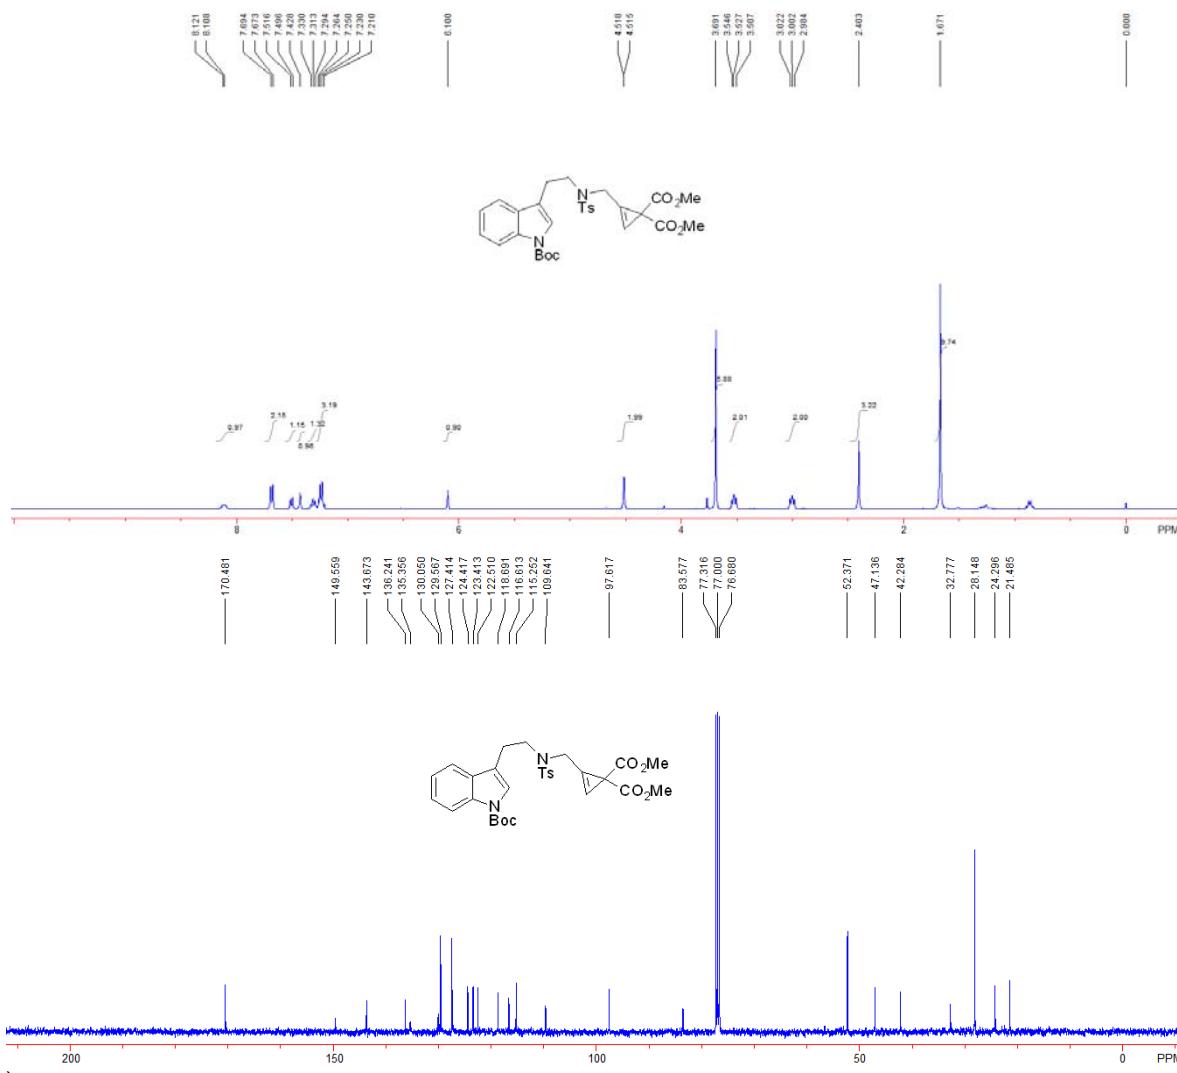

**Typical Procedure for the Preparation of **1a**.** A solution of dimethyl diazomalonate (474 mg, 3.0 mmol) in dry dichloromethane (1 mL) was added via a syringe pump over 3 hrs to a stirred solution of  $\text{Rh}_2(\text{OAc})_4$  (8 mg, 0.01 mmol) and **S1a** (905 mg, 2.0 mmol) in dry dichloromethane (2 mL) at room temperature. After the addition was complete, the reaction mixture was stirred for additional 3 hrs. The solvent was removed under reduced pressure and the residue was purified by silica gel column chromatography.

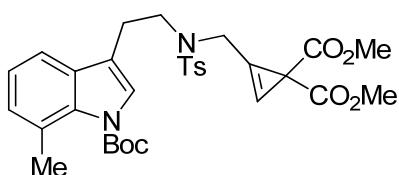

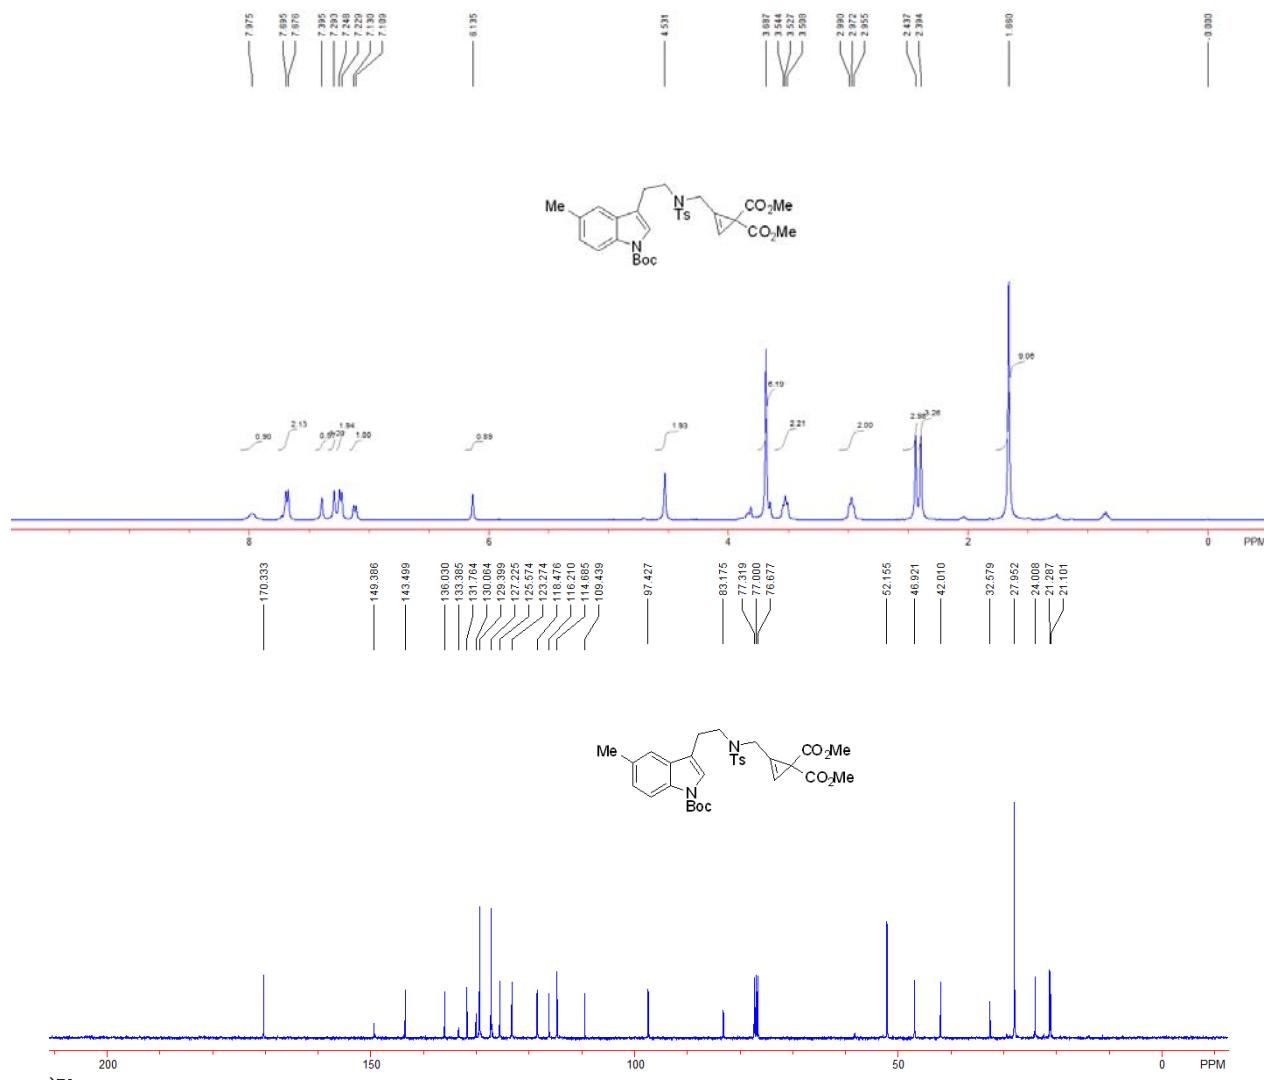

**Typical Procedure for the Preparation of **1a'**.** To a solution of **1a** (1.50 g, 2.57 mmol) in dichloromethane (5 mL) was added trifluoroacetic acid (1.46 g, 12.85 mmol). The reaction mixture was stirred at room temperature monitored by TLC. Once the starting material disappeared, the reaction was quenched by dropwise addition of saturated aqueous sodium bicarbonate. The subsequent biphasic mixture was then diluted with ethyl acetate. The organic layer was separated, dried over anhydrous sodium sulphate, filtered and concentrated *in vacuo*. The residue was purified by silica gel column chromatography.

## General Procedure and Spectroscopic Data of the Products 2

A solution of compound **1** (0.1 mmol) was stirred at ambient temperature in the mixed solvent of TFA and DCM (1:1). The reaction was monitored by TLC. When the deprotected compound was observed, then 1.5 eq of HOTf was added into the reaction system. Once the reaction was complete, the solvent was removed under reduced pressure and the residue was chromatographed on silica gel (elution with petroleum ether/ethyl acetate = 3/1) to provide the corresponding product **2**.

### General procedures and spectroscopic data of compounds 3

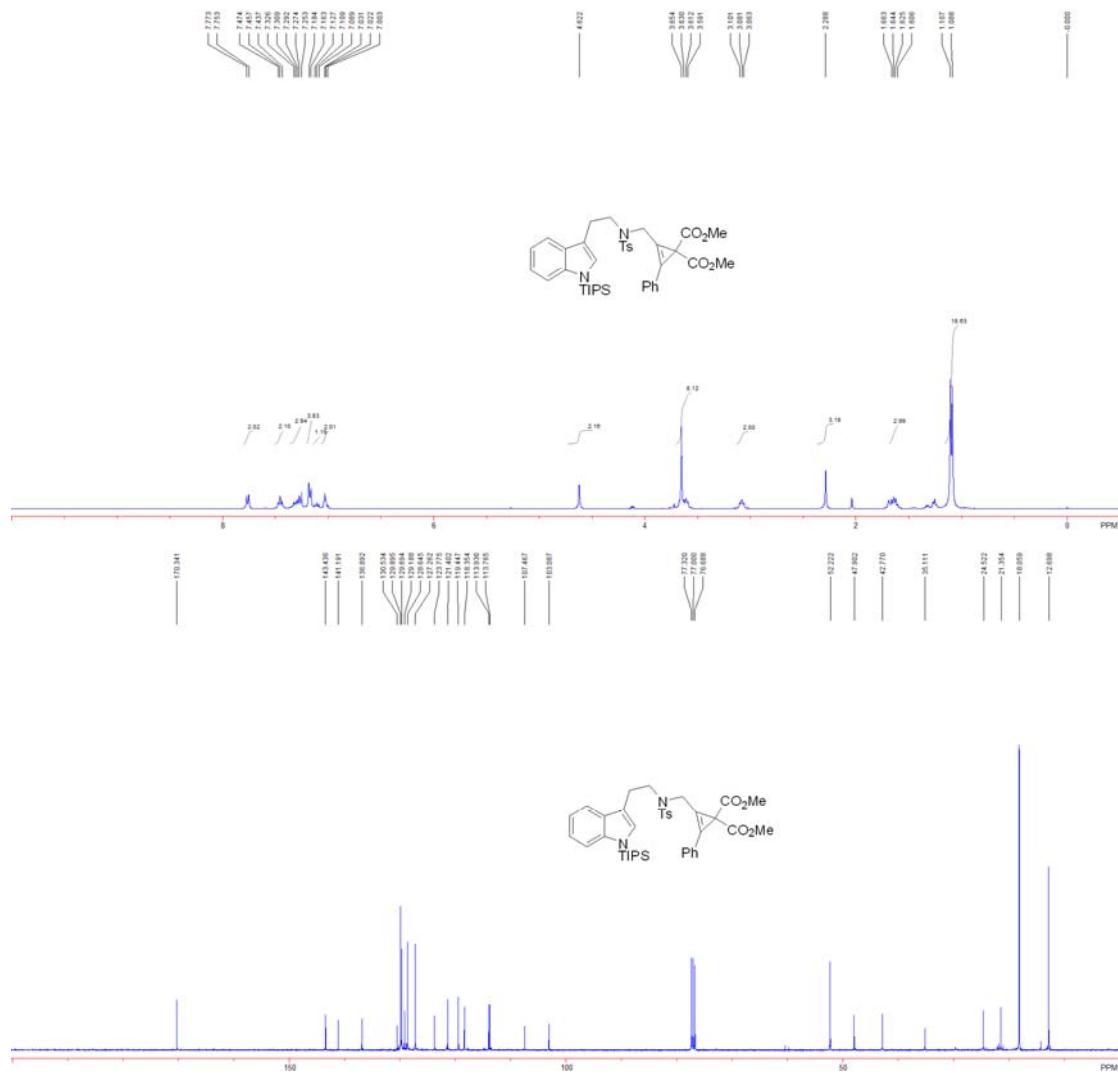

**Typical Procedure for the Preparation of S3a.** A solution of dimethyl diazomalonate (2.77 g, 17.5 mmol) in dry dichloromethane (2 mL) was added via a syringe pump over 3 hrs to a stirred solution of Rh<sub>2</sub>(OPiv)<sub>4</sub> (34 mg, 0.055 mmol) and **S2a** (2.7 g, 11.0 mmol) in dry dichloromethane (10 mL) at room temperature. After the addition was complete, the reaction mixture was stirred for additional 3 hrs. The solvent was removed under reduced pressure and the residue was purified by silica gel column chromatography.

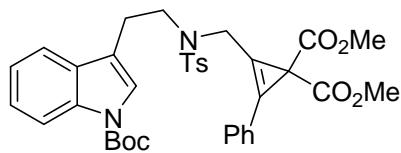

**Typical Procedure for the Preparation of S4a.** A solution of **S3a** (1.62 g, 4.3 mmol) in dry THF (10 mL) was added tetrabutylammonium fluoride (1.36 g, 4.3 mmol) at room temperature. The reaction mixture was stirred for 2 hrs. The solvent was removed under reduced pressure and the residue was purified by silica gel column chromatography.

Compound **3a** was produced according to the typical Mitsunobu reaction procedure.

## General Procedure and Spectroscopic Data of the Products 4

A solution of compound **3** (0.1 mmol) was stirred at ambient temperature in the mixed solvent of TFA and DCM (1:1). Then 10 mol% of HOTf was added into the reaction system. Once the reaction was complete, the solvent was removed under reduced pressure and the residue was chromatographed on silica gel (elution with petroleum ether/ethyl acetate = 5/1) to provide the corresponding product **4**.
