I. General Remarks

¹H NMR spectra were recorded on a Bruker 400 MHz spectrometer in CDCl₃. Chemical shifts are reported in ppm with the internal TMS signal at 0.0 ppm as a standard. The data are reported as (s = single, d = double, t = triple, q = quarte, m = multiple or unresolved, brs = broad single, coupling constant(s) in Hz, integration). ¹³C NMR spectra were recorded on a Bruker 100 MHz spectrometer in CDCl₃. Chemical shifts are reported in ppm with the internal chloroform signal at 77.0 ppm as a standard. Enantiomeric ratios were determined by HPLC, using a chiralpak OD-H column with hexane and *i*-PrOH as solvents. **1a**, **1h**, **1i** were purchased from J&K Scientific and Aldrich. 1,3-Cyclopentadiene **1f** was cracked and distilled at 200°C. Various substituted 1,3-cyclohexadienes **1b-1e**, **1g**, **1j** and nitroso compounds **2a-2e** were prepared according to the literature procedure^{1,2}.

II. General Procedure for the Asymmetric Nitroso Diels-Alder Reaction of 1,3-dienes with nitroso compounds

Under argon atmosphere, TF-Biphamphos (17.6 mg, 0.022 mmol) and CuBF₄ (6.3 mg, 0.020 mmol) were dissolved in 4 mL DCM, and stirred at room temperature for about 30 min. The mixture was then cooled into -80°C and nitroso compound (0.20 mmol) dissolved in 0.5 mL of DCM was added. After stirred for 10 min, the 1,3-diene (0.24 mmol) dissolved in another 0.5 mL of DCM was added dropwise. The reaction mixture was gradually warmed to -40°C and kept at this temperature until the reaction complete. Then the organic solvent was removed and the residue was purified by column chromatography to give the product, which was then directly analyzed by HPLC to determine the enantiomeric excess. All the racemic samples were prepared by mixing the nitroso compounds (0.20 mmol) with the dienes (0.24 mmol) in DCM at 0°C
