Supplementary Data

Fig. S1: UV-VIS spectrum of the applied light source.

Fig. S2: EDS spectra of the SbOCl/TiONT and SbOCl/TiO₂ composites.

Fig. S3: TEM images of the pristine SbOCl/TiO₂ composites.

Fig. S4: TEM images of the SbOCl/TiO₂ composites calcined at 400 °C.

Fig. S5: XRD pattern of the SbOCl/TiO₂ composites.

Fig. S6: Diffuse reflectance UV-VIS spectra of the SbOCl/TiONT composites.

Fig. S7: Diffuse reflectance UV-VIS spectra of the SbOCl/TiO₂ composites.

Fig. S8: Kubelka-Munk plots of the SbOCl/TiONT composites.

Fig. S9: Kubelka-Munk plots of the SbOCl/TiO₂ composites.

Table S1: Optical band gap energies of the SbOCl/TiONT composites.

Fig. S10: Methyl orange decomposition curves using SbOCl/TiONT composites.

Fig. S11: Methyl orange decomposition curves using SbOCl/TiO₂ composites.

Table S2: Apparent rate constants of the SbOCl/TiONT MO decolorization reaction.

Table S3: Apparent rate constants of the SbOCl/TiO₂ MO decolorization reaction.

Table S4: Photocatalytic properties of various photocatalysts in MO decolorization tests.

Fig. S12: Mott-Schottky plot of the pH1 Sb_xO_yCl_z/TiONT composite.

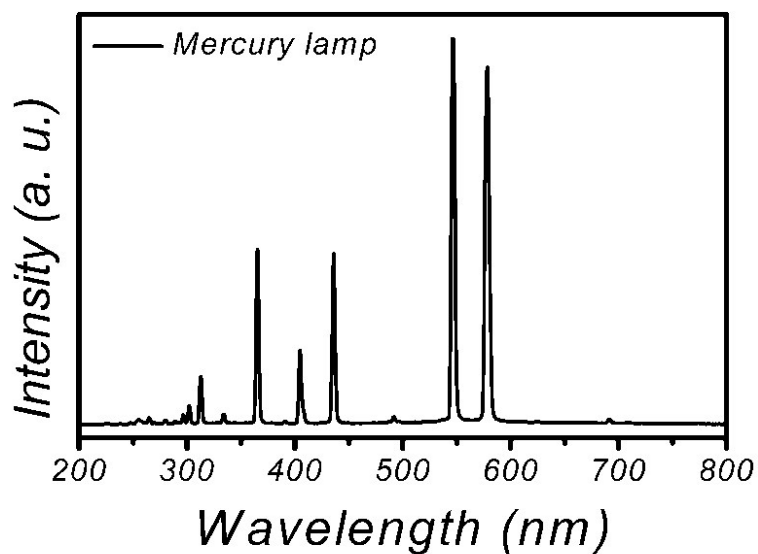

Fig. S1. UV-VIS spectrum of the mercury vapor light source used in the photocatalytic dye decomposition test reactions.

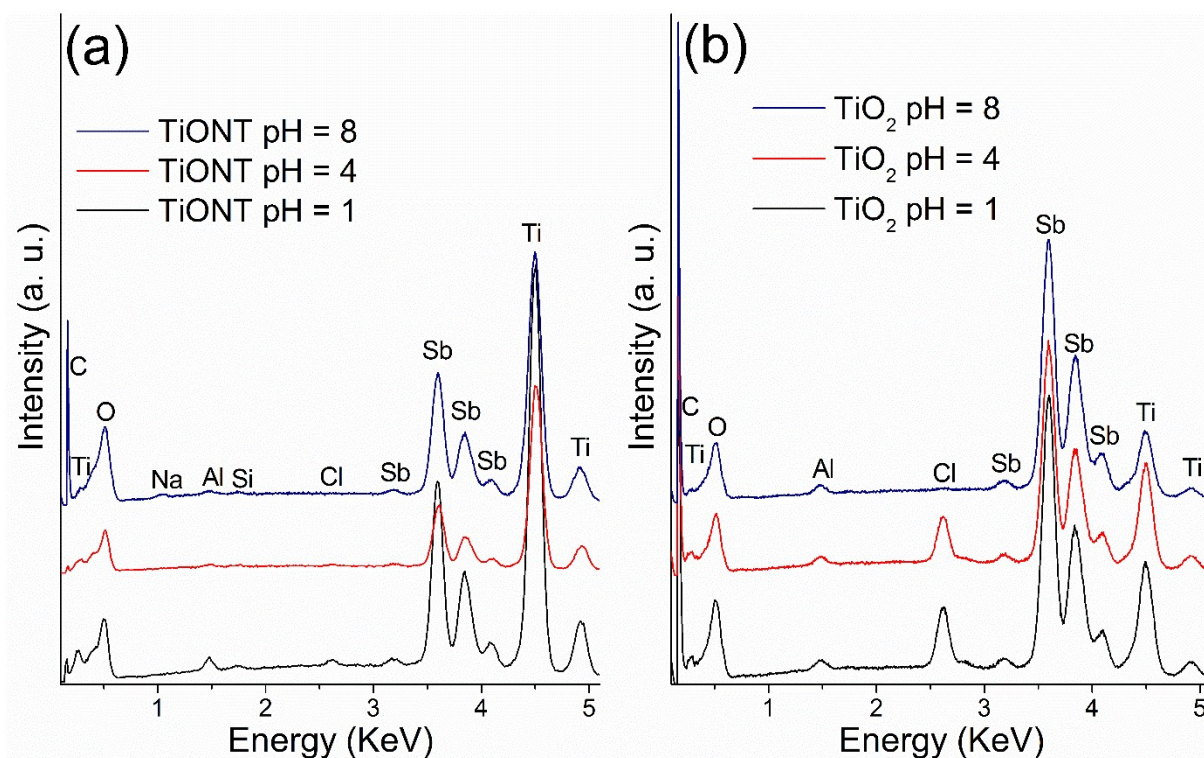

Fig. S2. EDS spectra of the $\text{Sb}_x\text{O}_y\text{Cl}_z$ decorated TiONT composites. The presence of antimony is clearly seen in all spectra.

Fig. S3. TEM images of the pristine anatase TiO_2 nanoparticles (a), and nanoparticles decorated with $\text{Sb}_x\text{O}_y\text{Cl}_z$ synthesized at pH = 1 (b), 4 (c), and 8 (d). The corresponding particle size distributions cannot be determined from TEM images.

Fig. S4. TEM images of the pristine anatase TiO_2 nanoparticles (a), and nanoparticles decorated with $\text{Sb}_x\text{O}_y\text{Cl}_z$ synthesized at pH = 1 (b), 4 (c), and pH 8 (d) after heat treatment at 400 °C in air atmosphere for 1 hour. The corresponding particle size distributions cannot be determined from TEM images.

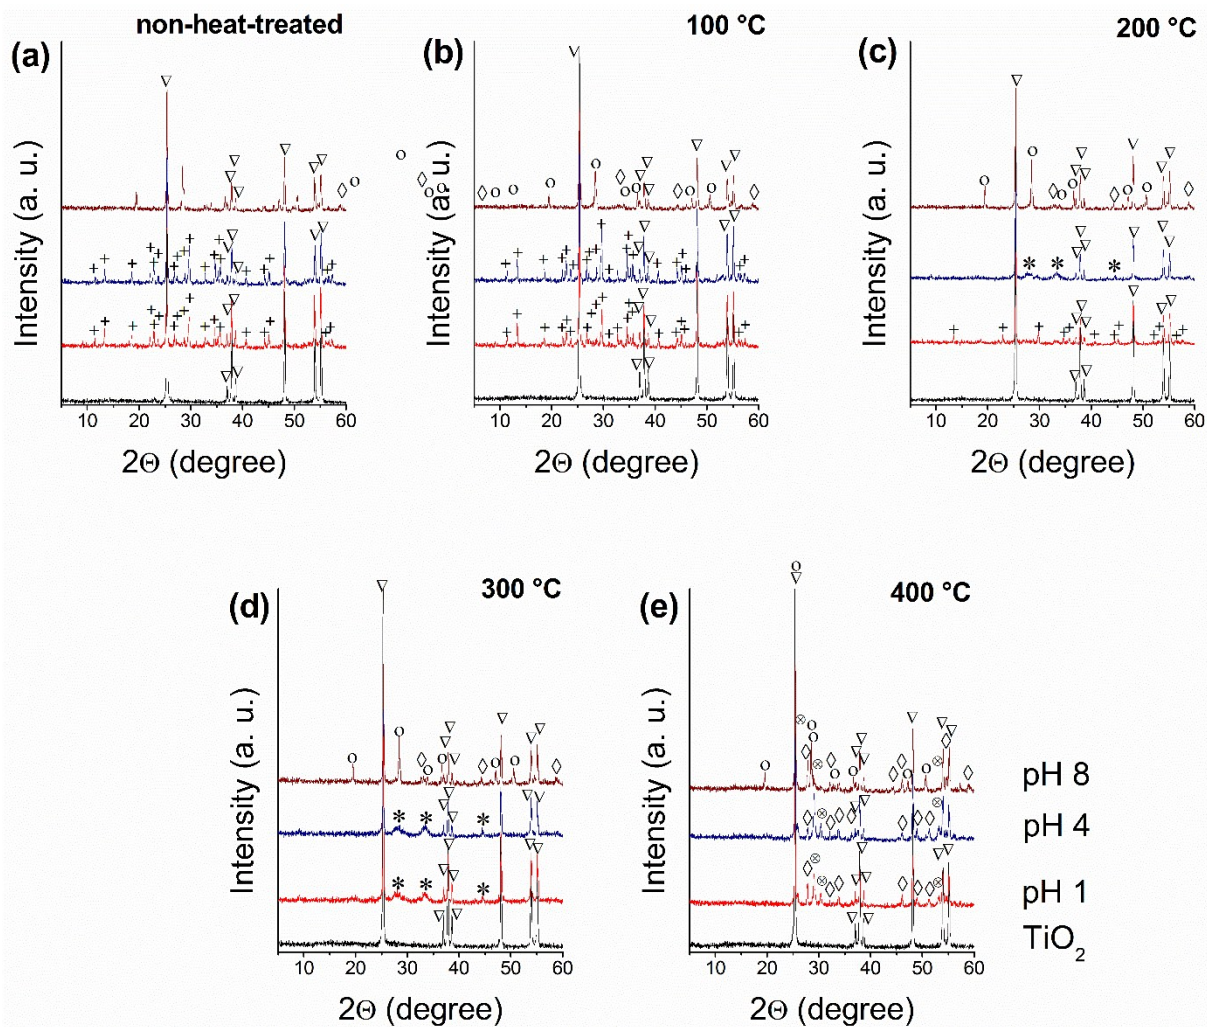

Fig. S5. XRD patterns of the as-prepared (a) and the heat treated TiO_2 samples calcined at 373 K (b), 473 K (c), 573 K (d), and 673 K (e). Anatase phase is marked by “∇”. The symbol “+” belongs to $\text{Sb}_8\text{O}_{11}\text{Cl}_2(\text{H}_2\text{O})_6$, “*” to $\text{Sb}_8\text{O}_{11}\text{Cl}_2$, “o” to valentinite Sb_2O_3 , ◇ to senarmontite Sb_2O_3 , and ⊗ to the cervantite Sb_2O_4 .

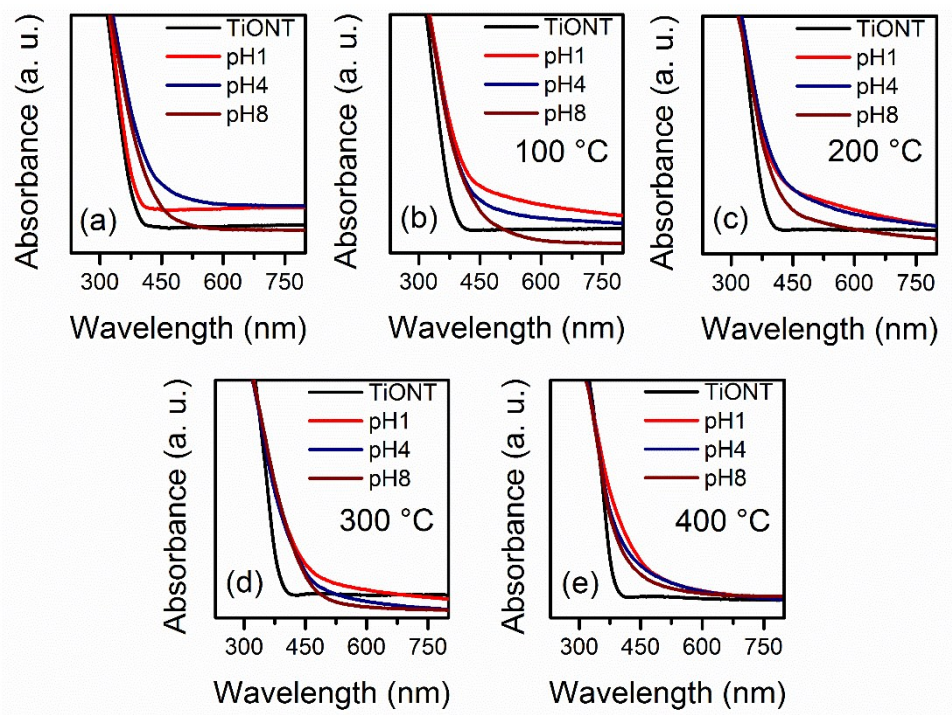

Fig. S6. Diffuse reflectance UV-VIS spectra of the $\text{Sb}_x\text{O}_y\text{Cl}_z/\text{TiONT}$ composites before heat treatment (a), after calcination at 100 (b), 200 (c), 300 (d), and 400 °C (e) in air for 1 hour.

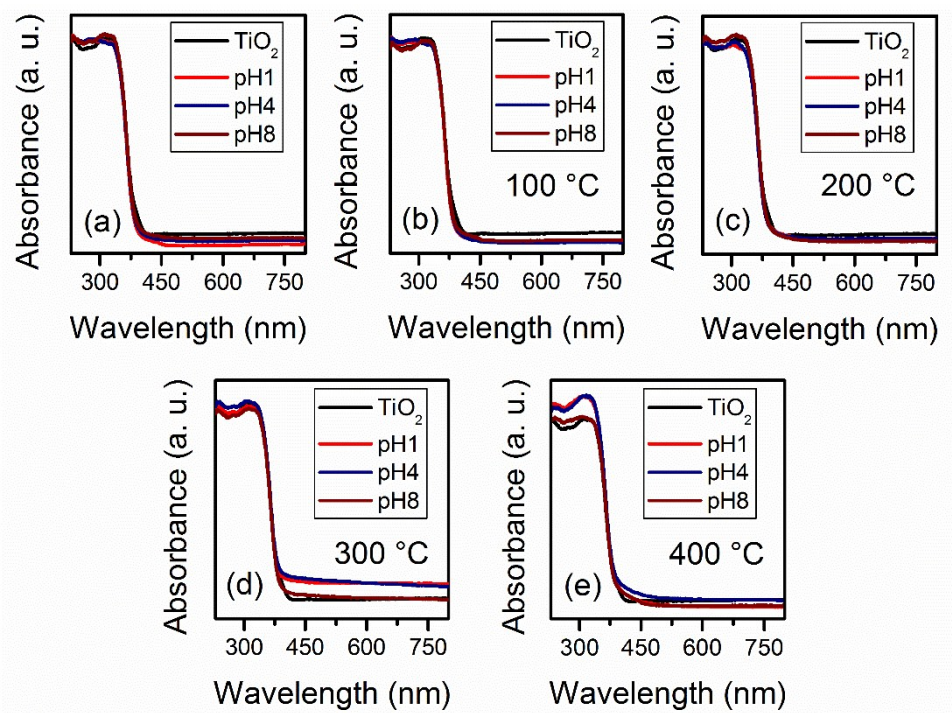

Fig. S7. Diffuse reflectance UV-VIS spectra of the $\text{Sb}_x\text{O}_y\text{Cl}_z/\text{TiO}_2$ composites before heat treatment (a), after calcination at 100 (b), 200 (c), 300 (d), and 400 °C (e) in air for 1 hour.

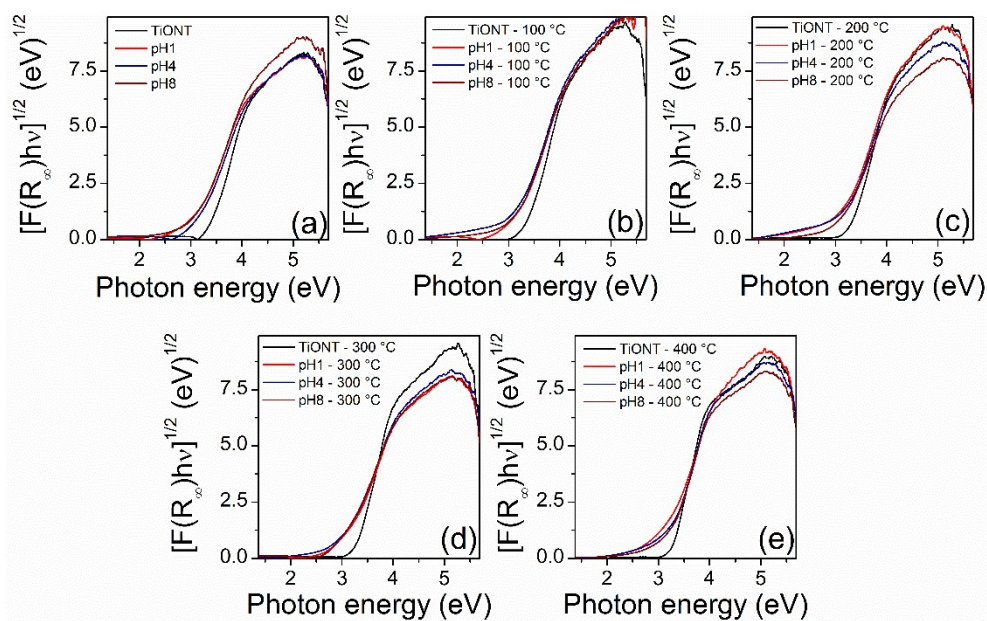

Fig. S8. Diffuse reflectance UV-VIS spectra in the Kubelka-Munk formalism of the $\text{Sb}_x\text{O}_y\text{Cl}_z/\text{TiONT}$ composites before heat treatment (a), after calcination at 100 (b), 200 (c), 300 (d), and 400 °C (e) in air for 1 hour.

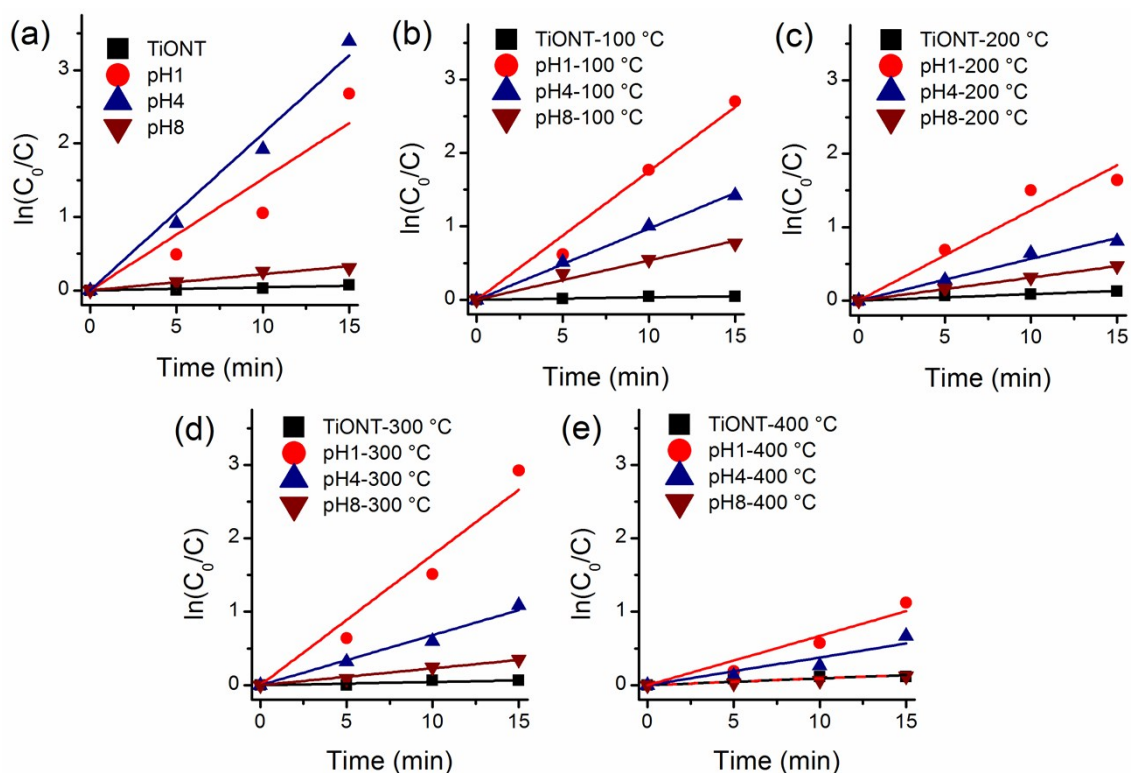

Fig. S9. Diffuse reflectance UV-VIS spectra in the Kubelka-Munk formalism of the $\text{Sb}_x\text{O}_y\text{Cl}_z/\text{TiO}_2$ composites before heat treatment (a), after calcination at 100 (b), 200 (c), 300 (d), and 400 °C (e) in air for 1 hour.

Table S1Optical band gap energies of the $\text{Sb}_x\text{O}_y\text{Cl}_z/\text{TiO}_2$ composites before and after calcination.

Samples	Band gap energy (eV)				
	TiO ₂	pH1	pH4	pH8	Average
No calcination	3.36	3.04	3.08	3.04	3.05 ± 0.02
100 °C	3.37	3.12	3.04	3.12	3.09 ± 0.05
200 °C	3.28	3.10	3.10	3.11	3.10 ± 0.01
300 °C	3.28	3.02	3.00	2.98	3.00 ± 0.02
400 °C	3.25	3.13	3.20	3.18	3.17 ± 0.04

**Fig. S10.** Photocatalytic dye decomposition curves of methyl orange (MO) under UV-VIS irradiation using $\text{Sb}_x\text{O}_y\text{Cl}_z/\text{TiO}_2$ composites. As-prepared composites (a), composites heat treated at 100 (b), 200 (c), 300 (d), and 400 °C (e) in air for 1 hour.

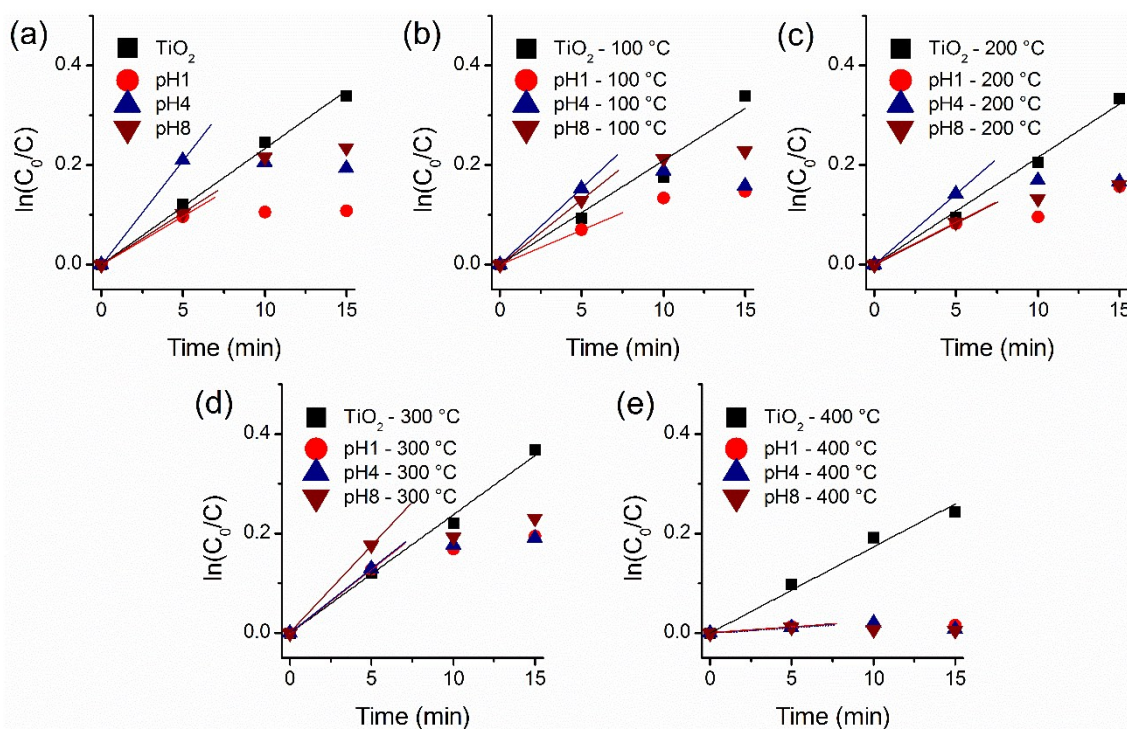

Fig. S11. Photocatalytic dye decomposition curves of methyl orange (MO) under UV-VIS irradiation using $\text{Sb}_x\text{O}_y\text{Cl}_z/\text{TiO}_2$ composites.

Table S2

First-order apparent rate constants of the MO decolorization reaction in the $\text{Sb}_x\text{O}_y\text{Cl}_z/\text{TiO}_2$ composites.

Samples	Apparent rate constant ($\times 10^{-3} \text{ min}^{-1}$)			
	TiO ₂	pH1	pH4	pH8
No calcination	4.09	151.75	213.21	22.02
100 °C	3.26	174.94	96.90	53.51
200 °C	8.83	123.03	56.93	31.37
300 °C	4.37	177.49	68.17	22.96
400 °C	9.25	67.21	40.59	7.37

Table S3

First-order apparent rate constants of the MO decolorization reaction in the $\text{Sb}_x\text{O}_y\text{Cl}_z/\text{TiO}_2$ composites.

Samples	Apparent rate constant ($\times 10^{-3} \text{ min}^{-1}$)			
	TiO ₂	pH1	pH4	pH8
No calcination	27.30	13.00	21.10	17.70
100 °C	24.89	15.10	18.30	17.70
200 °C	25.51	14.50	18.00	11.90
300 °C	27.79	19.00	19.00	18.00
400 °C	21.31	1.00	2.90	0.30

Table S4

Photocatalytic properties of various photocatalysts in methyl orange decolorization experiments.

Photocatalyst	Photocatalytic activity	Reference photocatalyst and its activity	Enhancement factor	Ref.
Sb ₂ S ₃ /Sb ₄ O ₅ Cl ₂	83% (VIS) in 1h	Sb ₄ O ₅ Cl ₂ : 1%	83	[1]
	70% (NIR) in 2h	Sb ₂ S ₃ : 36%	1.9	
Sb ₂ S ₃ /g-C ₃ N ₄	58% (UV) in 1h	Sb ₂ S ₃ : 17%	3.4	[2]
	82% (VIS) in 1h	Sb ₂ S ₃ : 20%	4.1	
gCN-Sb ₂ S ₃ /Sb ₄ O ₅ Cl ₂	95% (VIS) in 1h	g-C ₃ N ₄ : 6%	15.8	[3]
	99% (UV) in 45 min		7.6	
BiOCl (001)	5% (VIS) in 3h	no catalyst (UV): 13%	1.7	[4]
	59% (UV) in 45 min		4.5	
BiOCl (010)	33% (VIS) in 3h	no catalyst (VIS): 3%	11	[4]
	100% (VIS) in 10 min		100	
BiOCl		no catalyst: 1%		[5]
Bi ₇ F ₁₁ O ₅ /BiOCl	80% (UV) in 30 min	BiOCl: 39%	2.1	[6]
BiOI	82% (VIS) in 2h	-	-	[7]
g-C ₃ N ₄ /BiOI	92% (VIS) in 2h	-	-	
BiOI/TiO ₂	92% (VIS) in 3h	TiO ₂ : 4%	23	[8]

The method for determining band edge values was described earlier by X. Xiao et al. (X. Xiao, S. Tu, M. Lu, H. Zhong, C. Zheng, X. Zuo and J. Nan, Appl. Catal., B, 2016, **198**, 124–132.). Briefly, the flat band potential of the pH1 sample was determined by electrochemical impedance spectroscopy (EIS) in 0.5 M Na₂SO₄ solution in a three-electrode configuration using an ACM Instruments Gill AC electrochemical workstation. Pt foil as the counter electrode and Ag/AgCl (3M KCl) reference electrode were used for the measurements. All potentials in the study refer to the normal hydrogen electrode (NHE) potential. The working electrode were prepared by drop-casting on a glassy carbon electrode (3 mm in diameter) surface. The impedance was measured at a constant frequency varying the applied potential. The capacitance of the space charge layer can be determined by equation (1) where Z_{im} is the imaginary part of measured Z^* impedance, i is imaginary unit, and f is the ac-voltage frequency:

$$C_{sc} = \frac{-i}{2\pi f Z_{im}} \quad (1)$$

For the determination of the flat band potential, C^{-1} from Eq. 1 was depicted against the

applied potential, and the linear range of the dataset were fitted. Fig. S12. shows the resulted Mott-Schottky plot.

Fig. S12. Mott-Schottky plot of the $\text{Sb}_x\text{O}_y\text{Cl}_z/\text{TiONT}$ composite prepared at $\text{pH} = 1$, measured at 500 Hz frequency in 0.5 M Na_2SO_4 aqueous solution.

The intercept with the x axis gives the position of the conduction band of $\text{Sb}_4\text{O}_5\text{Cl}_2$ under flat band condition. Since the conduction band position and the band gap energy (from UV-Vis spectroscopy) is known, the position of the valence band can be calculated from the following equation:

$$E_{\text{Conduction Band}} - E_{\text{Band Gap}} = E_{\text{Valence Band}} \quad (2)$$

Band diagrams are based by on review of Bai et al.:

S. Bai, J. Jiang, Q. Zhang and Y. Xiong, *Chem. Soc. Rev.*, 2015, **44**, 2893-2939
