## Detailed computational information

All calculations were carried out with the Gaussian 09<sup>1</sup> computational suite as mentioned in the computational methods section of main manuscript. Geometry optimization of minimum and transition state structures were performed with Truhlar's M11 functional<sup>2</sup> and Pople's double  $\zeta$  6-31+G(d,p) basis set<sup>3, 4</sup>. Electronic energies were further improved with highly-correlated techniques including the composite G4(MP2)-6X method<sup>5</sup> and benchmark calculations with restricted coupled cluster theory RCCSD(T)<sup>6</sup> and Aldrich's triple  $\zeta$  def2-TZVP basis set<sup>7</sup> (see Schemes S1 and S2). The G4(MP2)-6X composite method introduced by Chan and Radom constitutes a series of single-point energy calculations and this composite method was reported to perform close to the G4 level.<sup>5</sup> Thermal and entropic corrections (at 298.15K) were calculated using the standard textbook formulae for the statistical thermodynamics of an ideal gas under the harmonic oscillator / rigid rotor approximation, and combined with G4(MP2)-6X and RCCSD(T) electronic energies to obtain the Gibbs' free energies.

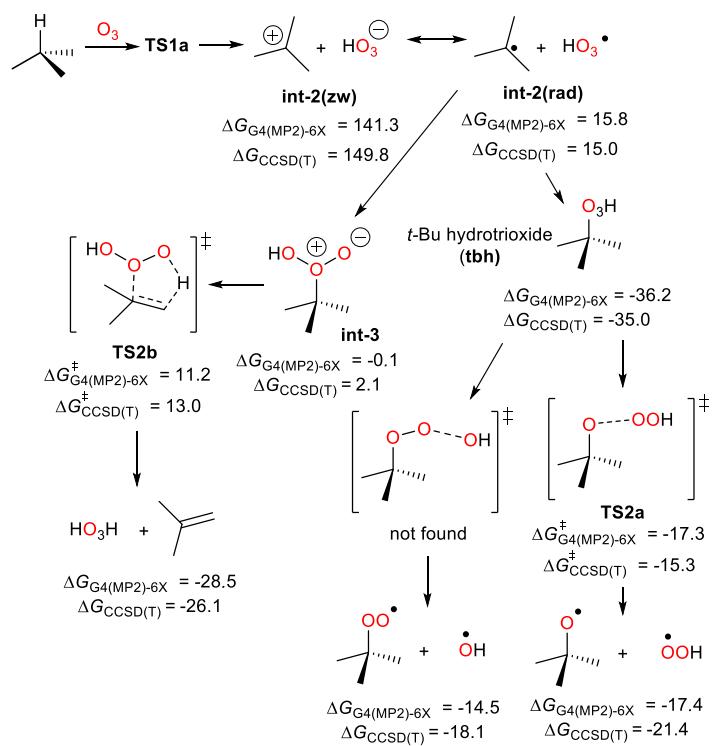

## RCCSD(T) and G4(MP2)-6X benchmark studies

In scheme S1, G4(MP2)-6X and RCCSD(T) free energies for the first O<sub>3</sub> C-H bond oxidation elementary step were compared and were found to agree to within 2 to 1 kcal/mol.

**Scheme S1.** Benchmark for RCCSD(T) and G4(MP2)-6X. Reaction and activation free energies in kcal/mol relative to starting materials for 1<sup>st</sup> H $\cdots$ O<sub>3</sub> abstraction.

The free energy comparison was subsequently carried out for the following oxidation-decomposition process in Scheme S2. Both computational methods show good agreement in terms of reaction free energies ( $\Delta G$ ) and free energy barriers ( $\Delta G^\ddagger$ ) with respect to the starting materials isobutane and ozone. G4(MP2)-6X thus demonstrates excellent accuracy at a much lower computational cost and is suitable to model larger molecules.

**Scheme S2.** Reaction and activation free energies RCCS(T) and G4(MP2)-6X comparison in kcal/mol for subsequent decomposition processes.

**Table S1. Summary of electronic energies at G4(MP2)-6X and RCCSD(T) for isobutane and corrections at M11/6-31+G(d,p) level of theory<sup>a</sup>**
