General procedure for solvothermal reactions in flame-sealed glass tube vessel. A meter long borosilicate glass tube measuring $10 \times 8 \mathrm{~mm}(\mathrm{o} . \mathrm{d} \times \mathrm{i} . \mathrm{d})$, was divided into six equal portions with a marker. Using a glass cutter, the long tube was cut into three shorter tubes by only cutting every other mark. The cut ends of the tube were etched using an oxygen-propane torch. The final glass tubes were made by melting the intermediate glass tubes at the mark with the torch. After the reactants and solvents were loaded into to the glass tubes, a hose adaptor was used to connect the glass tube to a high vacuum ( 10 mTorr ) using a Schlenk line constructed by fitting the open end of the tube inside a short length of standard rubber hose that was further affixed to a ground glass tap which could be closed to insolate this assembly from dynamic vacuum. The mixture was flash frozen at 77 K (liquid $\mathrm{N}_{2}$ ), evacuated to an internal pressure of 150 mTorr ( $\pm 10 \mathrm{mTorr}$ ), and sealed under static vacuum. Upon sealing, the length of the tube was reduced to $18-20 \mathrm{~cm}$; the reactant mixture was allowed to thaw and was placed in an isothermal oven inside a sand bath. After the reaction was complete, the tube was allowed to cool to room temperature and the tube was opened using a glasscutter, and the solids were isolated by filtration.

HKUST-1. The synthesis was modified from Tranchemontagne et al. ${ }^{\text {S1 }}$ Trimesic acid $(0.250 \mathrm{~g}, 1.190 \mathrm{mmol})$ was dissolved in 50 mL of a $1: 1: 1$ mixture of $\mathrm{DMF} / \mathrm{Etanol} / \mathrm{H}_{2} \mathrm{O}$ in a 250 mL round bottom flask equipped with a magnetic stirrer (Solution A). $\mathrm{CuCl}_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}$ $(0.500 \mathrm{~g}, 2.974 \mathrm{mmol})$ was dissolved in 50 mL of a $1: 1: 1$ mixture of $\mathrm{DMF} / \mathrm{EtOH} / \mathrm{H}_{2} \mathrm{O}$ (Solution B). Solution B was added drop wise to Solution A at room temperature with stirring. The mixture was stirred for 24 h forming a blue crystalline solid that was isolated by filtration. The solid was rinsed three times with DMF and $\mathrm{CHCl}_{3}$. The blue powder was immersed in $\mathrm{CHCl}_{3}$ and stored 3 days in a desiccator, replacing the solvent six times during this period. The excess solvent was removed by decantation and the solvent-wet powder was dried under dynamic vacuum ( 10 mTorr ) for 24 h at room temperature. The resulting in a bright blue powder was stored under $\mathrm{N}_{2}$ in a desiccator.
