**Table S1** Adsorption/binding energies (eV) of C<sub>2</sub>H<sub>2</sub>, C<sub>2</sub>H<sub>3</sub> and C<sub>2</sub>H<sub>4</sub> on the possible adsorption sites over Cu(211), Ag(211) and Au(211). The corresponding input structures over Ag(211) are shown in Figure S1 as examples.

|                               |        | Cu(211)            | Ag(211)            | Au(211)            |
|-------------------------------|--------|--------------------|--------------------|--------------------|
| C <sub>2</sub> H <sub>2</sub> | B5     | -1.04              | 0.10               | -0.46              |
|                               | hcp    | -1.36              | 0.06               | -0.56              |
|                               | fcc    | -1.36 <sup>a</sup> | 0.22               | -0.30              |
| C <sub>2</sub> H <sub>3</sub> | bridge | -2.44              | -1.74              | -2.00              |
|                               | hcp    | -2.44 <sup>a</sup> | -1.74 <sup>a</sup> | -2.00 <sup>a</sup> |
| C <sub>2</sub> H <sub>4</sub> | 2σ     | -0.42              | -0.10              | -0.24              |
|                               | π      | -0.54              | -0.21              | -0.35              |

<sup>a</sup> These structures changed to the most stable one after optimization.

**Figure S1** Input structures of possible  $\text{C}_2\text{H}_2$ ,  $\text{C}_2\text{H}_3$  and  $\text{C}_2\text{H}_4$  adsorption configurations.

**Figure S2** Possible transition state structures of  $\text{C}_2\text{H}_2$  hydrogenation with  $\text{H}_2$  over  $\text{Ag}(211)$  and  $\text{Au}(211)$ . The corresponding reaction barriers are also shown here.
