Fig. S5 HMQC of 1a in DMSO- d_6	10
Fig. S6 ^{195}Pt NMR of 1a in DMSO- d_6 , 107.5 MHz.....	10
Fig. S7 ^1H NMR of 2a in DMSO- d_6 , 500 MHz . Insets are showing the ^{195}Pt satellites corresponding to A) H6 and B) H7 (right) protons respectively.	11
Fig. S8 ^{13}C NMR of 2a in DMSO- d_6 , 125 MHz.....	11
Fig. S9 ^{13}C DEPT-135 of 2a in DMSO- d_6 , 125 MHz.....	12
Fig. S10 HMQC of 2a in DMSO- d_6	12
Fig. S11 ^{195}Pt NMR of 2a in DMSO- d_6 , 107.5 MHz.	13
Fig. S12 ESI-MS speciation recorded during monitoring of stability kinetics of 1a by ^1H NMR after 3 d in 20% PBS (pD 7.4, prepared in D_2O) – DMSO- d_6 mixture.	13
Fig. S13 Observed and simulated isotopic pattern of $[\mathbf{3} + \text{Na}^+]^+$ found in ESI-MS during monitoring of stability kinetics of 1a by ^1H NMR after 3 d.	14
Fig. S14 Observed and simulated isotopic pattern of $[\mathbf{3} + \text{K}^+]^+$ found in ESI-MS during monitoring of stability kinetics of 1a by ^1H NMR after 3 d.	15
Fig. S15 Observed and simulated isotopic pattern of $[\mathbf{1a} + \text{Na}^+]^+$ found in ESI-MS during monitoring of stability kinetics of 1a by ^1H NMR after 3 d.	16
Fig. S16 Observed and simulated isotopic pattern of $[\mathbf{1a} + \text{K}^+]^+$ found in ESI-MS during monitoring of stability kinetics of 1a by ^1H NMR after 3 d.	17
Fig. S17 Observed and simulated isotopic pattern of $[\mathbf{3} - 2\text{Cl}^- + 2\text{OH}^- + \text{H}^+]^+$ found in ESI-MS during monitoring of stability kinetics of 1a by ^1H NMR after 3 d.....	18
Fig. S18 Stack plot of stability kinetic study of the 2a by ^1H NMR in 20% PBS (pD 7.4, prepared in D_2O) – DMSO- d_6 mixture. ¶ indicates unchanged 2a	19
Fig. S19 ESI-MS speciation recorded during monitoring of the 9-EtG binding study with 1a by ^1H NMR after 4 d in 20% PBS (pD 7.4, prepared in D_2O) – DMSO- d_6 mixture.	19
Fig. S20 Observed and simulated isotopic pattern of $[\mathbf{3d}$ (Scheme 3)] found in ESI-MS during monitoring of the 9-EtG binding study with 1a by ^1H NMR after 4 d.....	20

Fig. S21 Observed and simulated isotopic pattern of [3e (Scheme 3)] found in ESI-MS during monitoring of the 9-EtG binding study with 1a by ^1H NMR after 4 d.....	21
Table S3 Speciation of 1a observed during the hydrolysis, 9-EtG and GSH binding experiments, as detected by ESI-MS. The speciation studies were performed using aliquots from NMR tube while studying the kinetics using NMR.....	22
Fig. S22 Stack plot of aliphatic region during the binding kinetics study of 1a with 9-EtG (1:6) in 20% PBS (pD 7.4, prepared in D_2O) – $\text{DMSO-}d_6$ by ^1H NMR. The chemical shifts are depicting the presence of excess reactants (1a & 9-EtG) and two types of 9-EtG bound adducts (3d & 3e) after 10 d.	26
Fig. S23 ^1H NMR data during the binding kinetics study of 1a (15 mM) with 9-EtG (90 mM) in 20% PBS (pD 7.4, prepared in D_2O) – $\text{DMSO-}d_6$ by ^1H NMR just after mixing of reactants.	26
Fig. S24 ^{13}C NMR data during the binding kinetics study of 1a (15 mM) with 9-EtG (90 mM) in 20% PBS (pD 7.4, prepared in D_2O) – $\text{DMSO-}d_6$ by ^1H NMR just after mixing of reactants.	27
Fig. S25 HMQC data of aromatic region during the binding kinetics study of 1a (15 mM) with 9-EtG (90 mM) in 20% PBS (pD 7.4, prepared in D_2O) – $\text{DMSO-}d_6$ by ^1H NMR just after mixing of reactants.	27
Fig. S26 HMQC data of aliphatic region during the binding kinetics study of 1a (15 mM) with 9-EtG (90 mM) in 20% PBS (pD 7.4, prepared in D_2O) – $\text{DMSO-}d_6$ by ^1H NMR just after mixing of reactants.	28
Fig. S27 ^1H NMR data of aromatic region during the binding kinetics study of 1a (15 mM) with 9-EtG (90 mM) in 20% PBS (pD 7.4, prepared in D_2O) – $\text{DMSO-}d_6$ by ^1H NMR after 10 d.	28
Fig. S28 ^1H NMR data of aliphatic region during the binding kinetics study of 1a (15 mM) with 9-EtG (90 mM) in 20% PBS (pD 7.4, prepared in D_2O) – $\text{DMSO-}d_6$ by ^1H NMR after 10 d.	29
Fig. S29 ^{13}C NMR data of aromatic region during the binding kinetics study of 1a (15 mM) with 9-EtG (90 mM) in 20% PBS (pD 7.4, prepared in D_2O) – $\text{DMSO-}d_6$ by ^1H NMR after 10 d.	29
Fig. S30 ^{13}C NMR data of aromatic region during the binding kinetics study of 1a (15 mM) with 9-EtG (90 mM) in 20% PBS (pD 7.4, prepared in D_2O) – $\text{DMSO-}d_6$ by ^1H NMR after 10 d.	30
Fig. S31 ^{13}C NMR data of aromatic region during the binding kinetics study of 1a (15 mM) with 9-EtG (90 mM) in 20% PBS (pD 7.4, prepared in D_2O) – $\text{DMSO-}d_6$ by ^1H NMR after 10 d.	30
Fig. S32 ^{13}C NMR data of aliphatic region during the binding kinetics study of 1a (15 mM) with 9-EtG (90 mM) in 20% PBS (pD 7.4, prepared in D_2O) – $\text{DMSO-}d_6$ by ^1H NMR after 10 d.	31

Fig. S33 ^{13}C NMR data of aliphatic region during the binding kinetics study of 1a (15 mM) with 9-EtG (90 mM) in 20% PBS (pD 7.4, prepared in D_2O) – $\text{DMSO-}d_6$ by ^1H NMR after 10 d.	31
Fig. S34 HMQC data of aromatic region during the binding kinetics study of 1a (15 mM) with 9-EtG (90 mM) in 20% PBS (pD 7.4, prepared in D_2O) – $\text{DMSO-}d_6$ by ^1H NMR after 10 d.	32
Fig. S35 HMQC data of aromatic region during the binding kinetics study of 1a (15 mM) with 9-EtG (90 mM) in 20% PBS (pD 7.4, prepared in D_2O) – $\text{DMSO-}d_6$ by ^1H NMR after 10 d.	32
Fig. S36 HMQC data of aliphatic region during the binding kinetics study of 1a (15 mM) with 9-EtG (90 mM) in 20% PBS (pD 7.4, prepared in D_2O) – $\text{DMSO-}d_6$ by ^1H NMR after 10 d.	33
Fig. S37 HMQC data of aliphatic region during the binding kinetics study of 1a (15 mM) with 9-EtG (90 mM) in 20% PBS (pD 7.4, prepared in D_2O) – $\text{DMSO-}d_6$ by ^1H NMR after 10 d.	33
Table S4A Selected ^1H NMR signals upon 9-EtG with 1a at the starting point ($t = 10$ min) and after 10 d supporting various speciation.	34
Table S4B Selected ^{13}C NMR signals upon 9-EtG with 1a at the starting point ($t = 10$ min) and after 10 d supporting various speciation.	34
Fig. S38 Stack plot of binding kinetics study of 1a with 9-EtG (1:6) in 20% PBS (pD 7.4, prepared in D_2O) – $\text{DMSO-}d_6$ by ^{195}Pt NMR. The data taken after 1 d shows no extra peak has generated except free complex (1a) peak at -74.7 ppm. After 10 d we find signals of 9-EtG bound complexes 3d & 3e at <i>ca.</i> -2210 ppm, but they are not well resolved.	35
Fig. S39 Stack plot of 9-EtG binding study with 2a by ^1H NMR in 20% PBS (pD 7.4, prepared in D_2O) – $\text{DMSO-}d_6$ mixture. ¶ indicates unchanged 2a	35
Fig. S40 Agarose gel electrophoresis of pUC19 treated with various concentrations (2, 5 & $10\ \mu\text{M}$) of 1a , 2a & cisplatin respectively A) without, B) with 10 equivalent of GSH for 24 h at $37\ ^\circ\text{C}$	36
Fig. S41 ESI-MS speciation recorded during monitoring of the GSH binding study with 1a by ^1H NMR after 3 h in 20% PBS (pD 7.4, prepared in D_2O) – $\text{DMSO-}d_6$ mixture.	36
Fig. S42 Observed and simulated isotopic pattern of [3c (Scheme 3) + H^+] $^+$ found in ESI-MS during monitoring of the GSH binding study with 1a by ^1H NMR after 3 h.	37
Fig. S43 Observed and simulated isotopic pattern of [3c (Scheme 3) + Na^+] $^+$ found in ESI-MS during monitoring of the GSH binding study with 1a by ^1H NMR after 3 h.	38
Fig. S44 Observed and simulated isotopic pattern of [(3 – 2Cl^-) + ($\text{GSH} - \text{H}^+$)] $^+$ found in ESI-MS during monitoring of the GSH binding study with 1a by ^1H NMR after 3 h.	39
Fig. S45 Observed and simulated isotopic pattern of [$\text{GSSG} + \text{H}^+$] $^+$ found in ESI-MS during monitoring of the GSH binding study with 1a by ^1H NMR after 3 h.	40
Fig. S46 Observed and simulated isotopic pattern of [$\text{GSSG} + \text{Na}^+$] $^+$ found in ESI-MS during monitoring of the GSH binding study with 1a by ^1H NMR after 3 h.	41

Fig. S47 Stack plot of aliphatic region during the binding kinetics study of 1a with GSH in 20% PBS (pD 7.4, prepared in D ₂ O) – DMSO- <i>d</i> ₆ by ¹ H NMR, where ‡, *, § and † indicate the signals of intact complex 1a , 3 , GSH bound complex 3c and aziridinium ion 3b respectively. c proton of free GSH shifted upfield (c') in bound complex 3c	42
Fig. S48 ESI-MS speciation recorded during monitoring of the GSH binding study with 1a by ¹ H NMR after 1 d in 20% PBS (pD 7.4, prepared in D ₂ O) – DMSO- <i>d</i> ₆ mixture.	43
Fig. S49 Observed and simulated isotopic pattern of [3b (Scheme 3)] found in ESI-MS during monitoring of the GSH binding study with 1a by ¹ H NMR after 1 d.	44
Fig. S50 Observed and simulated isotopic pattern of [GSH + H ⁺] ⁺ found in ESI-MS during monitoring of the GSH binding study with 1a by ¹ H NMR after 1 d.	45
Fig. S51 Observed and simulated isotopic pattern of [GSSG + H ⁺] ⁺ found in ESI-MS during monitoring of the GSH binding study with 1a by ¹ H NMR after 1 d.	46
Fig. S52 Observed and simulated isotopic pattern of [GSSG + Na ⁺] ⁺ found in ESI-MS during monitoring of the GSH binding study with 1a by ¹ H NMR after 1 d.	47
Fig. S53 Stack plot of binding kinetics study of 1a with GSH (1:6) in 20% PBS (pD 7.4, prepared in D ₂ O) – DMSO- <i>d</i> ₆ by ¹⁹⁵ Pt NMR. A) Before GSH addition, <i>i.e.</i> , free 1a , B) after GSH addition, <i>i.e.</i> , reduced 1a (3) C) after 4 h of GSH addition, <i>i.e.</i> , GSH bound 3 (3c) and D) after 1d where the GSH adduct (3c) peak vanishes.	48
Fig. S54 Stack plot of aromatic region during the binding kinetics study of 1a with ascorbic acid in 20% PBS (pD 7.4, prepared in D ₂ O) – DMSO- <i>d</i> ₆ by ¹ H NMR, where ‡, * and † indicate the signals of intact complex 1a , 3 and aziridinium ion 3b respectively.	49
Fig. S55 Stack plot of aliphatic region during the binding kinetics study of 1a with ascorbic acid in 20% PBS (pD 7.4, prepared in D ₂ O) – DMSO- <i>d</i> ₆ by ¹ H NMR, where ‡, * and † indicate the signals of intact complex 1a , 3 and aziridinium ion 3b respectively.	49
Fig. S56 Plots of cell viability (%) vs. log of concentrations of 1a against A) MCF-7, B) A549, C) MIA PaCa-2, D) HepG2, E) HEK293 and NIH 3T3 cell lines after incubation for 48 h determined from MTT assays under normoxic condition. The plots provided are for one independent experiment out of the three independent experiments.	50
Fig. S57 Plots of cell viability (%) vs. log of concentrations of 1a against A) MCF-7 and B) A549 cell lines after incubation for 48 h determined from MTT assays under normoxic condition in presence of 400 μM GSH. The plots provided are for one independent experiment out of the three independent experiments.	50
Fig. S58 Plots of cell viability (%) vs. log of concentrations of 1a against A) MCF-7, B) A549 and MIA PaCa-2 cell lines after incubation for 48 h determined from MTT assays under hypoxic condition. The plots provided are for one independent experiment out of the three independent experiments.	50
Fig. S59 Plots of cell viability (%) vs. log of concentrations of 1a against A) MCF-7, B) A549 and MIA PaCa-2 cell lines after incubation for 48 h determined from MTT assays under hypoxic condition in presence of 400 μM GSH. The plots provided are for one independent experiment out of the three independent experiments.	51

Fig. S60 Cell cycle arrest of MCF-7 treated with 1a for 24 h. (A) DMSO control, (B) 4 μ M, (C) 6 μ M and D) 8 μ M of 1a treated cells. The figure represents one independent experiment.....	51
Fig. S61 Cell cycle arrest of MIA PaCa-2 treated with 1a for 24 h. (A) DMSO control, (B) 2.5 μ M, (C) 3.5 μ M and D) 4.5 μ M of 1a treated cells. The figure represents one independent experiment.....	51
Fig. S62 Fluorescence microscopy image of MCF-7 cells after 24 h treatment with A) DMSO, B) 6 μ M and C) 8 μ M of 1a respectively. Bright and dark arrows are pointing towards the nuclei with deformed morphology.	52

Detailed experimental procedures

X-ray crystallography

X-ray diffraction measurement of single crystal was performed through Agilent supernova, Dual, Cu at zero, Eos diffractometer at 100(1) K using Mo X-ray source of wavelength 0.7107 Å. The processing of structure was conducted with the ShelXS¹ structure solution program using direct method and the refinement was accomplished with ShelXL¹ refinement package using least squares minimization. All the processing was executed through Olex2.² The non-hydrogen atoms were refined anisotropically by full matrix least-squares on F^2 . Some important crystallographic refine parameters and crystal data are summarized in Table S1 and Table 1 respectively. The ORTEP diagram was processed through POV-ray with 50% probability level. Crystallographic data for the structure has been deposited at the Cambridge Crystallographic Data Centre as supplementary publication, <https://deposit.ccdc.cam.ac.uk> and the CCDC number is 1449897.

NMR experiments

The samples for NMR stability and binding experiments were prepared in 20% PBS (pD 7.4, prepared in D₂O) in DMSO-*d*₆ or 20% H₂O in DMSO-*d*₆. The data were recorded in JEOL ECS 400 MHz spectrophotometer. 2D NMR of 9-EtG binding kinetics was measured in Bruker Avance III 500 MHz spectrometer. DCl or NaOD was used to adjust pD to 7.4 and uncorrected pD values are reported.³ The ESI-MS samples were prepared after taking the aliquots from NMR tubes followed by dilution in HPLC grade methanol. ¹⁹⁵Pt NMR of binding kinetics was recorded in Bruker Avance III 500 MHz spectrometer.

Interaction with plasmid DNA

Complexes of various concentrations (2, 5 & 10 μ M) were incubated for 24 h at 37 °C with 4 μ L of pUC19 DNA (stock concentration 30 ng μ L⁻¹) in a total volume of 20 μ L using 5 mM Tris-HCl (pH 7.4) containing 50 mM NaClO₄ and 0.5 mM EDTA. Stock solutions of complexes in DMF were used in such a way that the final DMF concentration in the reaction mixture doesn't exceed 10%. DNA control was also prepared with 10% DMF. Solutions of cisplatin were prepared in 1X PBS (pH 7.2). In the experiment with GSH, incubations were performed with 10 molar equivalent of GSH with respect to the concentration of the complexes used (i.e., 20, 50, 100 μ M respectively). After incubation the whole reaction mixture was loaded in a ethidium bromide pre-stained 1% agarose gel and electrophoresis was carried for about 2 h at 80 V.

Cell lines and culture

Breast adenocarcinoma (MCF-7), lung adenocarcinoma (A549) and mouse embryonic fibroblast (NIH 3T3) were obtained from Department of Biological Sciences, IISER Kolkata (purchased from ATCC). Human hepatocellular carcinoma (HepG2), human pancreatic carcinoma (MIA PaCa-2) were obtained from NCCS (Pune, India). Human embryonic kidney cell line (HEK293) was kindly donated by Prof. S. M. Srinivasula of IISER TVM, India. MCF-7, A549, HEK293, MIA PaCa2 and NIH 3T3 cells were maintained in the logarithmic phase in Dulbecco's Modified Eagles Medium (DMEM) while HepG2 was grown on Minimum Essential Medium (MEM). Both the media were supplemented with 10% fetal bovine serum (GIBCO) and antibiotics (100 units per ml penicillin and 100 μ g per ml streptomycin). Culture condition was maintained at a humid atmosphere of 95% air and 5% CO₂ at 37 °C. For Hypoxic condition oxygen was maintained at 1.5% while 5% CO₂ and other parameters were kept unaltered.

Cell viability assay

The cytotoxicity of the compounds against various cancer cell lines was evaluated based on MTT assay. Cells were seeded in 96-well microplate (Nunc) at a density of 6×10^3 viable cells per well in a volume of 200 μ L of medium. It was subsequently incubated at 37 °C in a 5% carbon dioxide atmosphere for 48 h. After incubation, the medium was renewed with a fresh one (200 μ L) followed by addition of metal complexes at appropriate concentrations. Stock solutions of metal complexes were made immediately prior to drug dilution in *ca.* 1:7 DMSO:culture media (v/v) followed by dilution with the same culture media to prepare various concentrations of solutions and added triplicate in well within 10 minutes of solution preparation so that the final DMSO concentration in well did not exceed 0.5% (The stability of **1a** in DMSO was checked up to *ca.* 12.5 h by ¹H NMR, Fig. S64†). The same percentage of DMSO was maintained in all types of cell based studies mentioned below. Upon 48 h of subsequent incubation, the existing drug containing media was removed followed by addition of fresh media along with 20 μ L of a 1 mg mL⁻¹ MTT in 1X PBS (pH 7.2). On incubation of the plates for 3 h at 37 °C in a humidified 5% CO₂ atmosphere, MTT was allowed to form formazan crystals in metabolically active cells. Finally media was removed after incubation and replaced with 200 μ L of DMSO in each well

that would solubilize the formazan crystals. The absorbance for each well was recorded at 515 nm^{4,5} using a BIOTEK ELx800 plate reader.

IC₅₀ values represent the drug concentration at which 50% cells are inhibited compared to control, which were calculated by fitting nonlinear curves in GraphPad Prism 5, using variable slope model constructed by plotting cell viability (%) versus log of drug concentration in μ M. Each independent experiment was carried out in triplicate.

For determining IC₅₀ in hypoxic condition the drugs were loaded in 96-well plate in normal atmospheric condition which took about 10 minutes before being transferred to the incubator maintained at 1.5% O₂ level. The equilibration time taken up by CO₂ incubator to reach hypoxic condition (1.5% O₂) was *ca.* 30 minutes after drug loading.

Metal accumulation study inside MCF-7 cells using ICP-MS

1.2×10^6 MCF-7 cells per 90 mm petri-dish containing 12 mL of DMEM were grown over 48 h and treated with the equitoxic (9 μ M) concentration of complex solutions (**1a**, **2a**, **3** and cisplatin) for an additional 24 h. Subsequently the media was discarded and cells were washed using 1X PBS (pH 7.4). After trypsinization cells were counted accurately for each drug treated sample and 1.0×10^6 number of cells were centrifuged to form cell pellet. The cell pellets were washed twice by re-dispensing in 1X PBS (pH 7.4) followed by centrifugation. Cell pellets were then digested with 200 μ L of extra pure (70% v/v) nitric acid (Sigma-Aldrich) at 100 °C for 12 h. Finally the digested cell suspension was diluted using Milli-Q water and the platinum content in the samples were analyzed on a Thermo Scientific XSERIES 2 ICP-MS instrument. Platinum standard solutions were freshly prepared before the experiment while analysis for all the samples were carried out in triplicates and the standard deviations were calculated.

Flow cytometry for cell cycle analysis

MCF-7 cells were seeded at 1.2×10^6 cells per plate in a 90 mm dia petri dish containing 12 mL of DMEM and incubated at 37 °C in a 5% carbon dioxide atmosphere for 48 h. After incubation, media was replaced with fresh media along with appropriate concentration of complex solutions and incubated for 24 h at previously mentioned culturing condition. Subsequently, drug containing media was removed and cells were harvested by trypsinization, washed twice with cold 1X PBS (pH 7.2) and fixed storing chilled 70% ethanol solution at 4 °C for 12 h. The cell pellets were re-suspended in 1X PBS solution comprising of PI (55 μ g mL⁻¹) and RNase A (100 μ g mL⁻¹) followed by an incubation at 37 °C for half an hour in dark for DNA staining. Finally the homogenized cell samples were analyzed in a BD Biosciences FACSCalibur flow cytometer and the resulting DNA histograms were quantified using the CellQuestPro software (BD).

DNA ladder assay for apoptosis detection

DNA ladder assay was performed in order to detect the cellular apoptosis induced by the test compound using a modified literature procedure.⁶ Briefly, MCF-7 cells (1.2×10^6 per plate) were seeded in a 90 mm diameter tissue culture petri dish followed by incubation for 48 h under previously mentioned culturing condition. After incubation, media was changed and appropriate concentrations of complex solutions were added. After 24 h of additional incubation, media was collected in a tube. Cells were washed with 1X PBS (pH 7.2) and the harvested cells (after trypsinization) along with washings were collected in the same tube. The cells were washed twice with 1X PBS (pH 7.2) and centrifuged at 2500 rpm for 10 minutes at 25 °C followed by cell lysis with 500 μ L of lysis buffer (20 mM Tris-HCl, 0.4 mM EDTA, 0.25% Triton-X 100, pH 8.0) after incubation at room temperature for 15 minutes. Then the lysed cells were centrifuged at 14000 rpm for 10 minutes at 4 °C and the supernatant was mixed well with 500 μ L of 1:1 (v/v) mixture of phenol and chloroform followed by centrifugation again at 14000 rpm for 10 minutes at 4 °C. After that the aqueous layer was carefully taken out and mixed with 55 μ L of 5 M NaCl solution and 550 μ L of isopropanol. The mixture was incubated at -20 °C for overnight followed by centrifugation at 14000 rpm for 10 minutes at 4 °C and the obtained pellet was washed with 70% ice-cold ethanol and finally air dried. The dried pellet was re-suspended in 40 μ L of 1X TE

buffer (10 mM Tris-HCl, 1 mM EDTA, pH 8.0) and 8 μ L of RNase solution (150 μ g mL⁻¹). After a quick centrifugation at 5000 rpm, the supernatant was loaded in 1.6% agarose gel containing ethidium bromide (1 μ g mL⁻¹) and run for 3 h at 60 V in 1X TBE buffer. Untreated cells were used as controls whereas 50 bp DNA ladder was used to track the migration of bands and fragmentation sizes on the agarose gel. Visible bands on gel were observed and picture taken on exposure to UV light through gel documentation system of Bio-Rad.

JC-1 staining assay for detection of mitochondrial membrane potential change

Seeding of cells, drug treatment and final harvesting of cells after 24 h of drug exposure were carried out using same procedure followed during DNA ladder assay. The harvested cells were then collected by centrifugation at 2500 rpm at 25 °C for 5 minutes, washed with 1X PBS (pH 7.2) by subsequent centrifugation and finally the cells were mixed with 500 μ L of JC-1 (10 μ g mL⁻¹ in 10% FBS supplemented 1X PBS). The cell suspension was subjected to 30 minutes incubation at 37 °C. The stained cells were collected by centrifugation and resuspended in 1X PBS (pH 7.2) for analysis in BD Biosciences FACSCalibur flow cytometer.

Colorimetric determination of caspase activity

Activation of Caspase was evaluated by colorimetry using Caspase Assay kit (Sigma-Aldrich). The free *p*-nitroaniline (*p*NA) was quantified after its cleavage from the Ac-DEVD-*p*NA substrate by released caspase from MCF-7 cells. It is known that the substrate Ac-DEVD-*p*NA is cleaved by caspase-7 or caspase-3, however activation of caspase-7 cleaves Ac-DEVD-*p*NA in this case since MCF-7 cells are known to be devoid of caspase-3. Briefly, 1.2×10^6 MCF-7 cells were seeded in 90 mm petri-dish and were incubated at 37 °C for 48 h. It was followed by treatment with the complex solutions for additional 24 h. After that, cells were collected and treated as per the kit manufacturer's protocol. Following 24 h incubation after addition of cell lysate, the absorbance of the released *p*NA was detected at 405 nm using ELISA plate reader. The data is graphically represented as the concentration of *p*NA released (nmol/min/ml) in y-axis and concentrations of treated drugs in x-axis. Each drug concentration has been performed in triplicate.

Optical microscopy imaging

For optical microscopic imaging, 12×10^3 number of MCF-7 cells were seeded per well in a 6-well plate over 48 h. Following the incubation, media was changed and required concentrations of the metal complex were added and further incubated for 24 h. The drug containing media were then removed and cells were fixed with 4% para formaldehyde solution in 1X PBS (pH 7.2). The fixed cells were washed with 1X PBS (pH 7.2) and incubated with DAPI (1 μ g mL⁻¹) for 2 minutes. Images of MCF-7 cells were acquired using OLYMPUS IX 81 epifluorescence inverted microscope at 60X magnification. Both DIC and fluorescence microscopy images were taken and processed using OLYMPUS Cell P software.

Growth kinetics of MCF-7 under the influence of compound

In order to evaluate the growth kinetics of MCF-7 under the influence of **1a**, periodic MTT assays were performed at an interval of 24 h for 6 days. Initially cells were seeded in six 96-well microplate (Nunc) at a density of 1.5×10^3 viable cells per well in a volume of 200 μ L of medium. It was subsequently incubated at 37°C in a 5% carbon dioxide atmosphere for 48 h, while one plate was removed for MTT assay at every 24 h. After 48 h of initial incubation, medium was removed and fresh medium was added (200 μ L) followed by addition of metal complexes at appropriate concentrations (**1a**: 12 μ M and 8 μ M; cisplatin: 12 μ M and 10 μ M). Stock solutions were freshly prepared in DMSO (such that concentration in well did not exceed 0.5%) prior to addition of complex in well. Plates were subsequently incubated at 37°C in a 5% carbon dioxide atmosphere for 48 h. After 48 h of treatment of cells with the compound, the compound containing media was removed and replenished with fresh media to facilitate the growth of existing cells. However MTT assays were carried out

using previously described method, on each replica at every 24 h interval upto 48 h of drug removal.

Wound assay (Migration)

Wound healing assay was used as a tool to evaluate the effect of drugs against cancer cell migration.⁷ Briefly, 1×10^6 cells were seeded in each well of a 6- well plate and incubated at 37 °C humidified CO₂ (5%) incubator till the formation of uniform monolayer in the plate. A sterile microtip was used to scratch across the well forming a denuded area over the cell monolayer and subsequently washed with 1X PBS (pH 7.2). Media was replaced to which sub IC₅₀ concentrations (6 and 8 μ M) of **1a** were added. Plates were incubated and images were captured at 12 h interval in Phase contrast microscope (OLYMPUS IX 81 epifluorescence inverted microscope). The quantification of wounded area was done using Image J software.

Hemolysis assay

The hemolysis assay was performed following standard method.⁸ In a brief, blood was collected in EDTA coated vials volunteered by a healthy human after taking written permission from him (assay protocol was approved by IISER Kolkata Ethics Committee). After centrifugation at 3000 rpm for 10 minutes, erythrocytes were washed thrice with cold PBS (pH 7.4) stored at 4°C re-suspended in the same buffer to a final concentration of 20% (v/v). The reaction vial contains 2% (final concentration) cell suspension and required concentrations of compound. Different concentrations of **1a** were prepared in DMSO and diluted in PBS (pH 7.4) such that the final concentration of compound remains 5, 10 and 15 μ M in the reaction vial, while the final DMSO concentration was kept at 0.2%. The vials were incubated at 37 °C for 1 h in a water bath with continuous shaking, after which the vials were centrifuged at 3000 rpm for 10 min and the supernatants were collected. Releases of hemoglobin in the supernatant were determined spectrophotometrically at 540 nm. Positive control in which complete hemolysis takes place was achieved using Triton X-100 (final concentration 0.2%). Appropriate DMSO (0.2%) containing PBS was used as negative control. The experiments were performed in triplicate and the percentages of hemolysis were calculated as follows:

Hemolysis percentage (%) = $(A_s - A_n)/(A_p - A_n) \times 100$, where A_s , A_n , A_p are absorbance of sample, negative control and positive control respectively at 540 nm.
