## 1. Elemental analysis results

## $\mathbf{L n M o}_{16}$ series

$\mathrm{TBA}=\left(n-\mathrm{C}_{4} \mathrm{H}_{9}\right)_{4} \mathrm{~N}$
$[\mathrm{TBA}]_{5}\left[\mathrm{~Tb}\left(\mathrm{Mo}_{8} \mathrm{O}_{26}\right)_{2}\right]\left(\mathrm{TbMo}_{16}\right):(0.487 \mathrm{~g}, 65.7 \%)$. Elemental analysis calcd (\%) for $\mathrm{C}_{80} \mathrm{H}_{180} \mathrm{~N}_{5} \mathrm{TbMo}_{16} \mathrm{O}_{52}$ : C, 25.70; H, 4.85; N, 1.87. Found: C, 25.05; H, 5.11; N, 1.82. The $\mathrm{Tb} / \mathrm{Mo}$ ratio obtained by SEM-EDX (scanning electron microscope with energy-dispersive X-ray analysis) are in agreement with the above formula obtained from the structure refinement (found: $\mathrm{Tb} / \mathrm{Mo}=8.85: 91.15$, calcd: $\mathrm{Tb} / \mathrm{Mo}=9.21: 90.79$ ).
$[\mathrm{TBA}]_{5}\left[\mathrm{Dy}\left(\mathrm{Mo}_{8} \mathrm{O}_{26}\right)_{2}\right]\left(\mathrm{DyMo}_{16}\right):(0.453 \mathrm{~g}, 59.8 \%)$. Elemental analysis calcd (\%) for $\mathrm{C}_{80} \mathrm{H}_{180} \mathrm{~N}_{5} \mathrm{DyMo}_{16} \mathrm{O}_{52}$ : C, 25.68; H, 4.85; N, 1.87. Found: C, 25.14; H, 4.91; N, 2.00; The Dy/Mo ratio: found: $\mathrm{Dy} / \mathrm{Mo}=9.40: 90.60$, calcd: $\mathrm{Dy} / \mathrm{Mo}=9.47: 90.53$.
$[\mathrm{TBA}]_{5}\left[\mathrm{Ho}\left(\mathrm{Mo}_{8} \mathrm{O}_{26}\right)_{2}\right]\left(\mathrm{HoMo}_{16}\right):(0.513 \mathrm{~g}, 67.7 \%)$. Elemental analysis calcd (\%) for $\mathrm{C}_{80} \mathrm{H}_{180} \mathrm{~N}_{5} \mathrm{HoMo}_{16} \mathrm{O}_{52}$ : C, 25.66; H, 4.86; N, 1.87; Found: C, 24.95; H, 4.87; N, 1.90; The $\mathrm{Ho} / \mathrm{Mo}$ ratio: found: $\mathrm{Ho} / \mathrm{Mo}=10.58: 89.42$, calcd: $\mathrm{Ho} / \mathrm{Mo}=9.53$ : 90.47.
$[\mathrm{TBA}]_{5}\left[\operatorname{Er}\left(\mathrm{Mo}_{8} \mathrm{O}_{26}\right)_{2}\right]\left(\mathrm{ErMo}_{16}\right):(0.492 \mathrm{~g}, 64.9 \%)$. Elemental analysis calcd (\%) for $\mathrm{C}_{80} \mathrm{H}_{180} \mathrm{~N}_{5} \mathrm{ErMo}_{16} \mathrm{O}_{52}$ : C, 25.65; H, 4.84; N, 1.87. Found: C, 25.30; H, 4.98; N, 1.88; The $\mathrm{Er} / \mathrm{Mo}$ ratio: found: $\mathrm{Er} / \mathrm{Mo}=9.90: 90.10$, calcd: $\mathrm{Er} / \mathrm{Mo}=9.58: 90.42$.
$[\mathrm{TBA}]_{5}\left[\mathrm{Tm}\left(\mathrm{Mo}_{8} \mathrm{O}_{26}\right)_{2}\right]\left(\mathrm{TmMo}_{16}\right):(0.437 \mathrm{~g}, 57.6 \%)$. Elemental analysis calcd (\%) for $\mathrm{C}_{80} \mathrm{H}_{180} \mathrm{~N}_{5} \mathrm{TmMo}_{16} \mathrm{O}_{52}$ : C, 25.64; H, 4.84; N, 1.87. Found: C, 25.96; H, 5.04; N, 1.85; The $\mathrm{Tm} / \mathrm{Mo}$ ratio: found: $\mathrm{Tm} / \mathrm{Mo}=10.94: 89.06$, calcd: $\mathrm{Tm} / \mathrm{Mo}=9.73: 90.27$.
$[\mathrm{TBA}]_{5}\left[\mathrm{Yb}\left(\mathrm{Mo}_{8} \mathrm{O}_{26}\right)_{2}\right]\left(\mathrm{YbMo}_{16}\right):(0.465 \mathrm{~g}, 61.2 \%)$. Elemental analysis calcd (\%) for $\mathrm{C}_{80} \mathrm{H}_{180} \mathrm{~N}_{5} \mathrm{YbMo}_{16} \mathrm{O}_{52}$ : C, 25.61; H, 4.84; N, 1.87. Found: C, 24.72; H, 4.89; N, 1.85; The $\mathrm{Yb} / \mathrm{Mo}$ ratio: found: $\mathrm{Yb} / \mathrm{Mo}=9.63: 90.37$, calcd: $\mathrm{Yb} / \mathrm{Mo}=9.99: 90.01$.

## $\mathbf{L n M o}_{10}$ series

$[\mathrm{TBA}]_{3}\left[\mathrm{~Tb}\left\{\mathrm{Mo}_{5} \mathrm{O}_{13}(\mathrm{MeO})_{4}\left(\mathrm{NNC}_{6} \mathrm{H}_{4}-p-\mathrm{NO}_{2}\right)\right\}_{2}\right] \cdot 1.5 \mathrm{CHCl}_{3}\left(\mathrm{TbMo}_{10}\right):(0.283 \mathrm{~g}, 80.6 \%)$. Elemental analysis calcd (\%) for $\mathrm{C}_{69.5} \mathrm{H}_{141.5} \mathrm{~N}_{9} \mathrm{O}_{38} \mathrm{Cl}_{4.5} \mathrm{Mo}_{10} \mathrm{~Tb}$ : C, 27.92; H, 4.77; N, 4.22; found: C, 27.97; H, 4.85; N, 4.12.
$[\mathrm{TBA}]_{3}\left[\mathrm{Dy}\left\{\mathrm{Mo}_{5} \mathrm{O}_{13}(\mathrm{MeO})_{4}\left(\mathrm{NNC}_{6} \mathrm{H}_{4}-p-\mathrm{NO}_{2}\right)\right\}_{2}\right] \cdot 1.5 \mathrm{CHCl}_{3}\left(\mathrm{DyMo}_{10}\right):(0.309 \mathrm{~g}, 87.9 \%)$. Elemental analysis calcd (\%) for $\mathrm{C}_{69.5} \mathrm{H}_{141.5} \mathrm{~N}_{9} \mathrm{O}_{38} \mathrm{Cl}_{4.5} \mathrm{Mo}_{10} \mathrm{Dy}$ : C, 27.89; H, 4.77; N, 4.21; found: C, 27.73; H, 4.71; N, 4.05.
$[\mathrm{TBA}]_{3}\left[\mathrm{Ho}\left\{\mathrm{Mo}_{5} \mathrm{O}_{13}(\mathrm{MeO})_{4}\left(\mathrm{NNC}_{6} \mathrm{H}_{4}-p-\mathrm{NO}_{2}\right)\right\}_{2}\right] \cdot 1.5 \mathrm{CHCl}_{3}\left(\mathrm{HoMo}_{10}\right):(0.325 \mathrm{~g}, 92.3 \%)$. Elemental analysis calcd (\%) for $\mathrm{C}_{69.5} \mathrm{H}_{141.5} \mathrm{~N}_{9} \mathrm{O}_{38} \mathrm{Cl}_{4.5} \mathrm{Mo}_{10} \mathrm{Ho}$ : C, 27.92; H, 4.77; N, 4.22; found: C, 27.97; H, 4.85; N, 4.12.
$[\mathrm{TBA}]_{3}\left[\operatorname{Er}\left\{\mathrm{Mo}_{5} \mathrm{O}_{13}(\mathrm{MeO})_{4}\left(\mathrm{NNC}_{6} \mathrm{H}_{4}-p-\mathrm{NO}_{2}\right)\right\}_{2}\right] \cdot 1.5 \mathrm{CHCl}_{3}\left(\mathrm{ErMo}_{10}\right):(0.243 \mathrm{~g}, 69.0 \%)$. Elemental analysis calcd (\%) for $\mathrm{C}_{69.5} \mathrm{H}_{141.5} \mathrm{~N}_{9} \mathrm{O}_{38} \mathrm{Cl}_{4.5} \mathrm{Mo}_{10} \mathrm{Er}$ : C, 27.85; H, 4.76; N, 4.21; found: C, 27.68; H, 4.76; N, 4.07.
$[\mathrm{TBA}]_{3}\left[\mathrm{Yb}\left\{\mathrm{Mo}_{5} \mathrm{O}_{13}(\mathrm{MeO})_{4}\left(\mathrm{NNC}_{6} \mathrm{H}_{4}-p-\mathrm{NO}_{2}\right)\right\}_{2}\right] \cdot 1.5 \mathrm{CHCl}_{3}\left(\mathrm{YbMo}_{10}\right):(0.321 \mathrm{~g}, 91.0 \%)$. Elemental analysis calcd (\%) for $\mathrm{C}_{69.5} \mathrm{H}_{141.5} \mathrm{~N}_{9} \mathrm{O}_{38} \mathrm{Cl}_{4.5} \mathrm{Mo}_{10} \mathrm{Yb}$ : C, 27.79; H, 4.75; N, 4.20; found: C, 28.03; H, 4.80; N, 4.32.
$[\mathrm{TBA}]_{3}\left[\mathrm{Nd}\left\{\mathrm{Mo}_{5} \mathrm{O}_{13}(\mathrm{MeO})_{4}\left(\mathrm{NNC}_{6} \mathrm{H}_{4}-p-\mathrm{NO}_{2}\right)\right\}_{2}\right] \cdot 1.5 \mathrm{CHCl}_{3}\left(\mathrm{NdMo}_{10}\right):(0.330 \mathrm{~g}, 94.6 \%)$. Elemental analysis calcd (\%) for $\mathrm{C}_{69.5} \mathrm{H}_{141.5} \mathrm{~N}_{9} \mathrm{O}_{38} \mathrm{Cl}_{4.5} \mathrm{Mo}_{10} \mathrm{Nd}$ : C, 28.06; H, 4.79; N, 4.24; found: C, 28.46; H, 4.93; N, 4.32.

## 2. IR spectra

Fig. S1. FT-IR spectra of the precursor $[\mathrm{TBA}]_{4}\left[\beta-\mathrm{Mo}_{8} \mathrm{O}_{26}\right]$ and the $\mathrm{LnMo}_{16}$ series, where $\mathrm{Ln}^{\mathrm{III}}=\mathrm{Tb}$, Dy, $\mathrm{Ho}, \mathrm{Er}, \mathrm{Tm}$ and Yb , in the range of $1700-400 \mathrm{~cm}^{-1}$.

## 3. Crystal structure determination

## $\mathbf{L n M o}_{16}$ series

Crystals of $\mathrm{LnMo}_{16}$ are extremely efflorescent and solvent loss occurs immediately after they are separated from their mother solutions. Therefore, although the crystals were quickly covered with Paratone-N oil and placed in a stream of cooled nitrogen ( 120 K ), some partial loss of solvent from the crystal could not be avoided. This fact causes a lowering in the quality of the single crystals as well as a large disorder in some of the organic cations present in the crystals (see below). A Nonius-Kappa CCD single-crystal diffractometer equipped with graphite-monochromated Mo $\mathrm{K} \alpha$ radiation $(\lambda=0.71073 \AA)$ was used for data collection. The CrysAlis software package ${ }^{1}$ was used for data collection routines, unit cell refinements, and data processing. Structure solution and refinement were carried out using SHELXS-97 and SHELXL-97. ${ }^{2}$ The asymmetric units of $\mathrm{LnMo}_{16}$ contain one complete polyoxometalate anion and five tetrabutylammonium $\left(\left[\left(n-\mathrm{C}_{4} \mathrm{H}_{9}\right)\right)_{4} \mathrm{~N}\right]^{+}$, $\mathrm{TBA}^{+}$ in short) cations. The structure solution reveals that some $\mathrm{TBA}^{+}$cations are extremely disordered, exhibiting unusually high isotropic thermal parameters. This fact was attributed to thermal liberation caused by the loss of solvent molecules from the crystal, which creates voids in the surroundings of these $\mathrm{TBA}^{+}$cations. Attempts of modelling this disorder using the facilities included in SHELXL-97 (PART, DELU and SIMU instructions) did not result in lower thermal parameters and even gave rise to unstable refinements in some cases. Therefore, only a small fraction of the disorder found in the butyl chains of the cations was modeled using the PART instructions. In particular, all the crystal structures contain one of the five $\mathrm{TBA}^{+}$cations (labelled TBA5) was found to be so disordered that some of the isotropic thermal parameters of the carbon atoms could not be refined and had to be fixed to avoid their blowing up. In addition, in structure $\mathrm{ErMo}_{16}$ some carbon atoms of this $\mathrm{TBA}^{+}$ cation could be found in difference maps and then the whole cation was removed from the experimental structure factors and modeled using the SQUEEZE procedure. ${ }^{3}$ Some acetonitrile molecules were also found in difference maps exhibiting large disorder and very high isotropic thermal factors. As they could not be modeled satisfactorily using atomic sites they were removed from the atomic list and their diffuse contribution was also
treated with the SQUEEZE program. This procedure gave void volumes and electron numbers per unit cell which correspond quite reasonably to 8 acetonitrile molecules per formula for all compounds in the series $\mathrm{LnMo}_{16}$ except for the case of $\mathrm{TbMo}_{16}$ where 6 acetonitrile molecules were found. All molybdenum and oxygen atoms were refined anisotropically in all six structures, while some $\mathrm{TBA}^{+}$cations were left isotropic. Hydrogen atoms on carbon atoms were included at calculated positions and refined with a riding model. Multi-scan or analytical numeric absorption corrections were applied to the data of $\mathrm{LnMo}_{16}$ using the software integrated in the program CrysAlis. Crystallographic parameters for $\mathrm{LnMo}_{16}$ are summarized in Table S1. Crystallographic data in cif format can be obtained with numbers CCDC 1446092-1446097 free of charge from the Cambridge Crystallographic Data Centre via www.ccdc.cam.ac.uk/data_request/cif.

## $\mathbf{L n M o}_{10}$ series

The molecular structures of the $\mathrm{Tb}, \mathrm{Dy}, \mathrm{Ho}, \mathrm{Er}$ and Yb analogues of $\mathrm{LnMo}_{10}$ were determined by X-ray diffraction after recrystallization in mixtures of $\mathrm{CHCl}_{3} / \mathrm{Et}_{2} \mathrm{O}$ or $\mathrm{CHCl}_{3} /$ thf $\left(\operatorname{thf}=\mathrm{C}_{4} \mathrm{H}_{8} \mathrm{O}\right)$.

Single crystals of each of the $\mathrm{Tb}, \mathrm{Dy}, \mathrm{Ho}, \mathrm{Er}$ and Yb analogues of $\mathrm{LnMo}_{10}$ were selected, mounted and transferred into a cold nitrogen gas stream. Intensity data was collected with a Bruker Kappa-APEX2 system using fine-focus sealed tube Mo-K $\alpha$ radiation. Unit-cell parameters determination, data collection strategy, integration and absorption correction were carried out with the Bruker APEX2 suite of programs. The structures were solved using SIR92 ${ }^{4}$ (Tb, Ho, Er) or SHELXT-2014 ${ }^{2}$ (Dy, Yb) and refined anisotropically by fullmatrix least-squares methods using SHELXL2013² (Tb, Ho, Er) or SHELXL20142 (Dy, Yb) within the WinGX suite ${ }^{5}$. The structures were deposited at the Cambridge Crystallographic Data Centre with numbers CCDC 1482838-1482842 and can be obtained free of charge via www.ccdc.cam.ac.uk.

The cell parameters of a crystal of $\mathrm{NdMo}_{10}$ were measured and found to be isostructural to the $\mathrm{Ho}, \mathrm{Er}$ and Yb derivatives.

Table S1. Crystallographic Data and Structure Refinement for compounds $\mathrm{LnMo}_{16}$, where $\mathrm{Ln}^{\mathrm{III}}=\mathrm{Tb}, \mathrm{Dy}, \mathrm{Ho}, \mathrm{Er}, \mathrm{Tm}$ and Yb .

## 7. Crystal field parameters

## Radial Effective Charge (REC) model

Our calculations start with the crystallographic/non-idealized atomic coordinates of the first coordination sphere of each magnetic centre. These are introduced as an input for the portable fortran 77 software code SIMPRE. This code parameterizes the electric field effect produced by the surrounding ligands, acting over the central ion, by using the following Crystal Field Hamiltonian expressed in terms of the Extended Stevens Operators (ESOs):

$$
\begin{equation*}
\hat{H}_{c f}(J)=\sum_{k=2,4,6} \sum_{q=-k}^{k} B_{k}^{q} O_{k}^{q}=\sum_{k=2,4,6} \sum_{q=-k}^{k} a_{k}\left(1-\sigma_{k}\right) A_{k}^{q}\left\langle r^{k}\right\rangle O_{k}^{q} \tag{1}
\end{equation*}
$$

where $k$ is the order (also called rank or degree) and $q$ is the operator range, that varies between $k$ and $-k$, of the Stevens operator equivalents $O_{k}^{q}$ as defined by Ryabov in terms of the angular momentum operators $J_{ \pm}$and $J_{z}$, where the components $O_{k}^{q}(c)$ and $O_{k}^{q}(s)$ correspond to the ESOs with $\mathrm{q} \geq 0$ and $\mathrm{q}<0$ respectively. Note that all the Stevens CF parameters $B_{k}^{q}$ are real, whereas the matrix elements of $O_{k}^{q}(\mathrm{q}<\mathrm{O})$ are imaginary. $a_{k}$ are the $\alpha, \beta$ and $\gamma$ Stevens coefficients for $k=2,4,6$, respectively, which are tabulated and depend on the number of $f$ electrons. $\sigma_{\mathrm{k}}$ are the Sternheimer shielding parameters of the $4 f$ electronic shell, and $\left\langle r^{k}\right\rangle$ are the expectation values of the radius.

In SIMPRE, the $A_{k}^{q}$ CF parameters are determined by the following relations

$$
\begin{align*}
& A_{k}^{0}=\frac{4 \pi}{2 k+1} \sum_{i=1}^{N} \frac{Z_{i} e^{2}}{R_{i}^{k+1}} Z_{k 0}\left(\theta_{i}, \varphi_{i}\right) p_{k q}  \tag{2.a}\\
& A_{k}^{q}=\frac{4 \pi}{2 k+1} \sum_{i=1}^{N} \frac{Z_{i} e^{2}}{R_{i}^{k+1}} Z_{k q}^{c}\left(\theta_{i}, \varphi_{i}\right) p_{k q}  \tag{2.b}\\
& A_{k}^{q}=\frac{4 \pi}{2 k+1} \sum_{i=1}^{N} \frac{Z_{i} e^{2}}{R_{i}^{k+1}} Z_{k|q|}^{s}\left(\theta_{i}, \varphi_{i}\right) p_{k|q|} \tag{2.c}
\end{align*}
$$

In the REC model ${ }^{8}$ the ligand is modeled through an effective point charge situated between the lanthanoid and the coordinated atom at a distance $R_{i}$ from the magnetic centre, which is smaller than the real metal-ligand distance ( $r_{i}$ ). To account for the effect of covalent electron sharing, a radial
displacement vector $\left(\mathbf{D}_{\mathbf{r}}\right)$ is defined, in which the polar coordinate $r$ of each coordinated atom is varied, $R_{e f f}=r_{i}-D_{r}$. The usual procedure is to obtain the $D_{r}$ parameter of each kind of donor atom from a collective fit of an observable (e.g. energy levels or magnetic properties) for a family of isostructural lanthanide complexes. At the same time, the charge value $\left(Z_{i}\right)$ is scanned in order to achieve the minimum deviation between calculated and experimental data, whereas $\theta_{\mathrm{i}}$ and $\varphi_{\mathrm{i}}$ remain constant. Due to the chemical similarity of the two families studied in this work, for the study of the series $\mathrm{LnMo}_{10}$ we have taken advantage of the REC parametes obtained in $\mathrm{LnMo}_{16}$. This has allowed the reduction of the number of parameters, keeping constant the product $f=D_{r} \cdot Z_{i}$ $=0.18216$, and varying the radial displacement to fit each lanthanoid complex of the series. The dispersion of REC parameters obtained and the function $Z_{i}=f / D_{r}$ are represented in Fig. S12.

Fig. S12. Radial displacement $\left(D_{r}\right)$ and effective charge $\left(Z_{i}\right)$ values obtained by fitting the temperature-dependence of the magnetic susceptibility in the series $\mathrm{LnMo}_{10}$ (circles). Collective fit of the series $\mathrm{LnMo}_{16}$ (black cross). Function $Z_{i}=f / D_{r}$.
