27 Keywords: quantification, Laser Ablation ICP-MS, visualization, particle solubility, ionic fraction

28

29

30 A comparison between nominal and real exposure concentrations at the start of the experiment
31 measured by neb-ICP-MS is shown in **Tab. S1**. Loss of substance from the exposure solutions may
32 result from adsorption, agglomeration and degradation of particles taking place during handling and
33 storage of suspensions.

34

35 **Tab. S1:** Comparison between nominal and measured nanoparticle exposure concentrations.

Nominal NP exposure concentrations	Real NP exposure concentrations	Recovery
60 µg Ag/L	16.2 µg Ag/L	27 %
60 µg Au/L	34.2 µg Au/L	57 %
60 µg Cu/L	52 µg Cu/L	87 %
60 µg Zn/L	55.5 µg Zn/L	93 %

36

37 Quantification of total element concentrations

38 Visualization by Laser Ablation ICP-MS

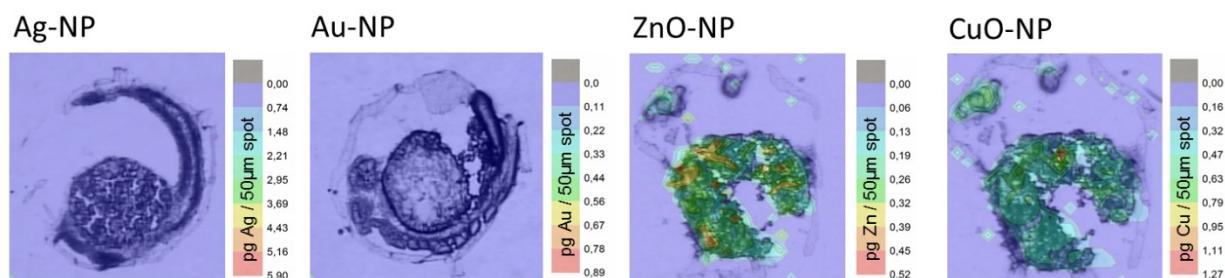

39 Prior to the testing of the NPs, untreated organisms were investigated to obtain information on the
40 natural background of the respective elements after digestion (**SI**, **Tab. S2**) and for LA-ICP-MS (**SI**,
41 **Fig. S1**). The background values were subtracted from all subsequent measurements.

42

43 **Tab. S2:** Natural background of respective elements obtained by neb-ICP-MS measurement of untreated
44 individual organisms (control) after digestion.

Nanomaterial	Concentration egg (ng/organism)	Concentration chorion (ng/chorion)	Concentration embryo (ng/embryo)
Ag-NP	0.12 ± 0.01	0.12 ± 0.01	0.11 ± 0.01
Au-NP	0.20 ± 0.01	0.18 ± 0.02	0.11 ± 0.01
CuO-NP	1.81 ± 0.23	1.06 ± 0.17	0.54 ± 0.18
ZnO-NP	2.73 ± 0.84	2.88 ± 0.94	2.65 ± 0.31

45

46 **Fig. S1:** Natural background of respective elements obtained by LA-ICP-MS measurement of untreated
47 organisms (control).

48 **Results**

49 Characterization of nanoparticle powders, suspensions, and exposure solutions

50 The hydrodynamic particle sizes measured for the exposure solutions in ISO-WATER differ in the
51 following range: 18 ± 2 nm (Au-NP) < 80 ± 1 nm (ZnO-NP) < 117 ± 24 nm (Ag-NP) < 132 ± 2 nm
52 (CuO-NP) at the start of the experiments. After 24 h exposure, sizes of 204 nm (Ag-NP), 420 nm
53 (CuO-NP), and > 5000 nm for Au and ZnO-NPs were measured in the exposure solutions, indicating a
54 high agglomeration of particles within the media. The dissolved fraction of the respective particle
55 solutions was determined to be 48.3 ± 7.2 % Ag (Ag-NP), 9.8 ± 5.5 % Cu (CuO-NP), and 58.1 ± 2.6 %
56 Zn (ZnO-NP) (**SI, Tab. S3**).

57

58 Impact of the chemical identity of NPs with respect to ionic fractions

59 In addition to the exposure with nanomaterials, the respective ionic substances (AgNO_3 , $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$,
60 $\text{ZnSO}_4 \cdot 7\text{H}_2\text{O}$) were tested to allow comparing to Ag-NP, CuO-NP, and ZnO-NP results. The obtained
61 concentrations after an exposure to $60 \mu\text{g element/l}$ for 24 h are 6.4 ± 1.8 ng/organism, $2.1 \pm$
62 0.4 ng/organism, and 0.4 ± 0.1 ng/organism for AgNO_3 , $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$, and $\text{ZnSO}_4 \cdot 7\text{H}_2\text{O}$, respectively
63 (**SI, Fig. S2**).

64 **Tab. S3:** Chemical and physical properties of investigated nanomaterials (powder, suspension, exposure solution).

	Characterization of powders		Characterization of suspensions					Characterization of exposure solutions (ISO water)	
Nanomaterial	X _{TEM} (nm)	BET (m ² /g)	Concentration (g/l)	Coating (c) / stabilizer (s)	Smoluchovski Zeta potential (mV)	X _{DLS} (nm)	Dissolved fraction (%)	X _{DLS} (nm) t ₀	X _{DLS} (nm) t ₂₄
AgNP	21 ± 8	-	4.0	PVP (c)	-19	117 ± 24	48.3 ± 7.2	135	204
AuNP	13 ± 1	-	0.06	Sodium citrate (s)	-38	18 ± 2	-	22	> 5000
CuO-NP	22-25	28	0.09	Tetrasodium pyrophosphate (s)	-64	132 ± 2	9.8 ± 5.5	131	420
ZnO-NP	10-15	60	5.6	-	+34	80 ± 1	58.1 ± 2.6	81	> 5000
