

Title of the manuscript:

Modeling Permeability of Drug-like Molecules through Mycobacterium Tuberculosis Cell Wall: An Analogue Based Approach" by Sridhara Janardhan, M. Ram Vivek and G. Narahari Sastry

Address for correspondence:

Centre for Molecular Modeling, CSIR-Indian Institute of Chemical Technology, Tarnaka, Hyderabad

Description about the script

Five QSAR models have been developed based the differential activity between enzyme based assays and cell-based assays. Hence, we have written a shell script based on these five models for the prediction and prioritization of unknown compounds. The script follows the following steps

1. Calculate PaDEL descriptors for the user given input sdf molecules.
2. Calculated PaDEL descriptors for the input molecules are saved as ouput.csv format with comma separated
3. The header in outout.csv is separated and saved as noheader.csv
4. Identifies the molecular descriptors obtained from the QSAR models (a total of 68 descriptors for five models)
5. Each descriptor header is mapped with the corresponding descriptor values calculated from PaDEL
6. Define the descriptor coefficients for each model along with the intercept value
7. Each calculated descriptor value is multiplied with the corresponding descriptor coefficient followed by addition of intercept.
8. This process continued iteratively for all the molecules and for all the models.
9. The predictive values for all the models are displayed as an output

Script:

```
#!/bin/sh
Java -jar ~/PaDEL-Descriptor.jar -2d -dir input.sdf -file output.csv
cat output.csv | sed "1 d" > noheader.csv
