## Computation Study

### Conformational Analysis

To locate the lowest energy conformations of the mono-alkylated intermediates corresponding to compound **16** ( $n = 3, 4$ ), a molecular mechanics conformational search was performed using Avagadro v1.1.1.<sup>1</sup> All searches started with the fully extended linear chains (all C-C bonds anti-periplanar). The conformational sampling was carried out using MMFF94 and a systematic rotor search.<sup>2</sup> All conformations that were within 3 kcal/mol of the global minimum were fully optimized in Gaussian09 using B3LYP/6-31G(d) to ensure the global minima were correctly assigned.<sup>3</sup>

### Reaction of second conformation of bromopropyl anion

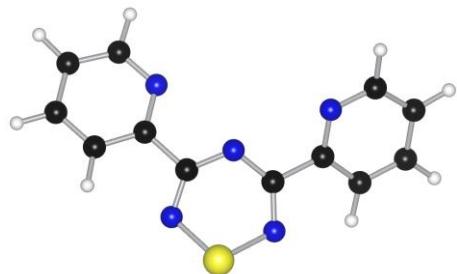

Deprotonation of **B** leads directly to a conformation of the bromopropyl anion **D1** that is also capable of directly undergoing cyclization (Figure S21). This conformation (**D1**) is 1.2 kcal/mol higher in energy than the lowest energy conformer **D**. The cyclization of this conformer occurs with a barrier of 12.9 kcal/mol. This suggest that cyclization of the bromopropyl anion can occur without any change in conformation and while the transition state from this conformation is higher in energy than that leading from the lowest energy conformation of the anion, it is still 3 kcal/mol lower in energy than the intermolecular substitution.

**Figure S21.** a) Intra- and intermolecular substitution paths for a second conformation of the bromopropyl anion **D1**. Reported values are free energies at 298K and are reported in kcal/mol. Energies for the intramolecular pathways include the energy of **Py<sub>2</sub>TTAH** (**C**). b) Structures associated with the cyclization pathway. Distances reported in Angstroms.

HF (B3LYP/6-31+G(d,p)) = -2464.6003596 Hartrees

HF (M062X/6-31+G(d,p)//B3LYP/6-31+G(d,p)) = -2463.8650475 Hartrees

Imaginary Frequencies: none found

Zero point correction = 0.514736 (Hartree/Particle)

Thermal correction = 0.436576 Hartrees

Coordinates from last standard orientation:
