Supporting Information

List of Supporting Information

Synthesis of the Cu ₂ O NPAs	S1
Encapsulation of Cu ₂ O NPAs using the sol-gel method	S2-S6
SEM images of particles from the PEG-400 reduction of Cu ₂ O@SiO ₂	S7
SEM images of particles from the removal of silica shell	S8
SEM images of hollow Cu particles from the etching of Cu@SiO ₂	S9
SEM image of Cu NPs from the PEG-400 reduction of Cu ₂ O NPAs	S10
IR and ¹ H NMR spectra of PEG-400 under 240 °C for 10 min and PEG-400	S11
SEM and TEM images of particles from glycerol and PEG reduction	S12
SEM image of particles from high temperature reduction	S13
XRD patterns of particles from PEG-400 reduction	S14
DSC-TGA curve of Cu ₂ O NPAs in N ₂ and XRD patterns	S15
SEM images of particles sintered at 600 °C	S16
SEM image of hollow Cu particles (1.5 μm)	S17
SEM image of hollow Cu particles (500 nm)	S18
N ₂ adsorption-desorption isotherms for hollow Cu particles (1.5 μm)	S19
Calculation of the density of hollow Cu particles	S20
UV-vis spectrum of 4-NP aqueous solution (12.5 μM)	S21
The absorbance versus time (<i>t</i>) plots for the reduction of 4-NP	S22
The absorbance versus time (<i>t</i>) plots for the reduction of 4-NP (catalyt)	S23
UV-vis spectra for the 4-NP reduction by NaBH ₄ catalyzed by Cu NPs	S24
Comparison of apparent rate constant (<i>k_{app}</i>) and activity factor (K)	Table S1
UV-vis spectra for the catalytic reduction of 4-NP with NaBH ₄ in each cycle	S25
SEM images of hollow Cu particles before (a) and after (b) 4 cycles of reduction	S26

Figure S1 Control of the size of Cu₂O NPAs by varying the PVP-29,000 concentration:

(a) 60 g/L (~500 nm), (b) 40 g/L (~930 nm), and (c) 20 g/L (~1.5 μm).

Figure S2 TEM images of the encapsulated Cu₂O NPAs (500 nm) with different TEOS concentrations: (a) 1.0 mM, (b) 3.0 mM, (c) 5.0 mM, (d) 10.0 mM, and (e) 20.0 mM. The concentrations of Cu₂O NPAs, H₂O, and NaOH were 0.5 g/L, 18 wt%, and 1.0 mM, respectively. (f) Shell thickness as a function of the TEOS concentration. (h) SEM image of silica-encapsulated Cu₂O NPAs at a TEOS concentration of 5.0 mM.

Figure S3 TEM images of the encapsulated Cu₂O NPAs (930 nm) with different TEOS concentrations: (a) 1.0 mM (28 nm), (b) 3.0 mM (45 nm), and (c) 5.0 mM (60 nm). The concentrations of Cu₂O NPAs, H₂O, and NaOH were 1.0 g/L, 18 wt%, and 1.0 mM, respectively. (d) SEM image of silica-encapsulated Cu₂O NPAs at a TEOS concentration of 5.0 mM.

Figure S4 TEM images of the encapsulated Cu₂O NPAs (1.5 μm) after two encapsulations: (a) first encapsulation, TEOS concentration of 10.0 mM (shell thickness: 24 nm), and (b) second encapsulation, TEOS concentration of 10.0 mM (shell thickness: 88 nm). The concentrations of Cu₂O, H₂O, and NaOH were 1.0 g/L, 18 wt%, and 1.0 mM, respectively. SEM image of silica-encapsulated Cu₂O NPAs after two encapsulations.

Figure S5 TEM images of the encapsulated Cu₂O NPs (500 nm) with different Cu₂O concentrations: (a) 0.25 g/L, (b) 0.5 g/L, (c) 1.0 g/L, and (d) 2.0 g/L. The concentrations of TEOS, H₂O, and NaOH were 3.0 mM, 18 wt%, and 1.0 mM, respectively. (e) Shell thickness as a function of Cu₂O concentration. (f) SEM image of silica-encapsulated Cu₂O NPs at a TEOS concentration of 5.0 mM.

Figure S6 TEM images of the encapsulated Cu_2O NPAs after two encapsulations. (a) 500 nm (shell thickness: 100 nm) and (b) 930 nm (shell thickness: 120 nm). (c, d) Relevant SEM images. TEOS concentrations for the first and second encapsulations were 3.0 mM and 5.0 mM, respectively. The concentrations of Cu_2O , H_2O , and NaOH were 1.0 g/L, 18 wt%, and 1.0 mM, respectively.

Figure S7 SEM images of particles from the PEG-400 reduction of $\text{Cu}_2\text{O}@\text{SiO}_2$ at 240 °C. (a) and (d) 500 nm particles with a shell thickness of 34 nm, (b) and (e) 930 nm particles with a shell thickness of 45 nm, and (c) and (f) 1.5 μm particles with a shell thickness of 88 nm.

Figure S8 SEM images of particles from the removal of the silica shell using NaOH solution (a) and (d) 500 nm particles, (b) and (e) 930 nm particles, and (c) and (f) 1.5 μm particles

Figure S9 SEM images of hollow Cu particles with different shell thickness, synthesized by the etching of Cu@SiO₂. (a) and (b) 28 nm, (c) and (d) 45 nm, and (e) and (f) 60 nm.

Figure S10 SEM image of particles from the PEG-400 reduction of Cu_2O NPAs at 240 °C

Figure S11 IR (a) and ^1H NMR (b) spectra of PEG-400 and PEG-400 solution under 240 °C for 10 min.

Figure S12 SEM images of particles with a shell thickness of 43 nm, synthesized from the reduction with glycerol (a) and PEG-10,000 (c). (b) and (d) are the relevant TEM images.

Figure S13 SEM image of particles with a shell thickness of 43 nm, from PEG-400 reduction under 270 °C.

Figure S14 XRD patterns of particles from the PEG-400 reduction of $\text{Cu}_2\text{O}@\text{SiO}_2$ (43 nm) under different temperatures for 30 min.

Figure S15 (a) DSC-TG measurement of Cu₂O NPAs in N₂ environment. (b) XRD patterns of samples.

Theoretically, the weight loss of Cu₂O@SiO₂ particles after reducing to Cu@SiO₂ is approximately 11%. According to the TGA curve, the weight loss of Cu₂O@SiO₂ particles is 20%. After DSC-TG measurement of Cu₂O NPAs in N₂, the XRD pattern revealed that it was dominated by the diffraction peaks of Cu. Thus, it is deduced that the PVP content is approximately 9 wt%.

Figure S16 SEM images of particles sintered at 600 °C for 1 h (a) with a shell thickness of 88 nm, and (b) 45 nm.

Figure S17 SEM image of hollow Cu particles with an average size of 1.5 μm .

Figure S18 SEM image of hollow Cu particles with an average size of 500 nm.

Figure S19 N_2 adsorption-desorption isotherms for hollow Cu particles (1.5 μm), with corresponding BJH pore-size distributions.

mass of hollow Cu (M): $\rho_{\text{Cu}} \times V_{\text{Cu shell}}$

$$\rho_{\text{Cu}} \times \frac{4}{3} \pi (R^3 - r^3)$$

Volume of hollow Cu (V): $\frac{4}{3} \pi R^3$

The density of hollow Cu: $\frac{M}{V} = \left[1 - \left(\frac{r}{R} \right)^3 \right] \times \rho_{\text{Cu}}$

$$\frac{V_{\text{Cu shell}}}{V_{\text{Cu}_2\text{O}}} = \frac{\frac{4}{3} \pi (R^3 - r^3)}{\frac{4}{3} \pi R^3} = 1 - \left(\frac{r}{R} \right)^3$$

Figure S20 Calculation of the density of hollow Cu particles

R and r are the average outer and inner radii of hollow particles, respectively. ρ_{Cu} is the density of solid Cu (8.96 g/cm³).

Previously, our calculation revealed that the Cu₂O volume is reduced by 70% to form Cu powders, making a highly porous structure, i.e., the reduced Cu NPs occupy only 30% of the Cu₂O volume ($V_{\text{Cu}_2\text{O}}$). Therefore, $V_{\text{Cu shell}} / V_{\text{Cu}_2\text{O}}$ is equal to 0.3. Accordingly, the density of hollow Cu is $0.3 \times 8.96 \text{ g/cm}^3 = 2.7 \text{ g/cm}^3$.

Figure S21 UV-vis spectrum of 4-NP in aqueous solution (12.5 μM).

Figure S22 UV-vis spectra for the 4-NP reduction by NaBH_4 at 25 $^{\circ}\text{C}$ without catalyst.

Figure S23 The absorbance versus time (t) plots for the reduction of 4-NP catalyzed by hollow porous Cu particles.

Figure S24 UV-vis spectra for the 4-NP reduction by NaBH_4 at 25 °C catalyzed by Cu NPs with an average size of 100 nm (0.02 mg/mL).

Table S1 Comparison of apparent rate constant (k_{app}) and activity factor (K) of different catalyst for the reduction of 4-NP.
