**Figure S37. ECD spectra simulation for associates between receptor 1 and *L*-phenylalanine.**

All calculations were performed using Gaussian09 software<sup>1</sup>. The structure of the complexes was optimized using M06-2X DFT functional<sup>2</sup> and 6-31G\*\* basis set.<sup>3</sup> A time-dependent DFT calculation, including the 50 more stable singlet excited states, was performed using B98 functional<sup>6</sup> and 6-31G\*\* basis set. This functional was chosen after considering its performance in the Truhlar benchmark database VES21 for electronic excitation energies involving valence excited states.<sup>2</sup> For both structures, the ECD spectra was simulated using a value of  $\sigma=0.4$  using Gausssum software<sup>7</sup>.

ECD spectra for the complex between *L*-phenylalanine and (2*R*,3*S*) receptor **1**. Comparison with experimental ECD spectra reveal that this absolute configuration corresponds to (-) receptor **1**.

ECD spectra for the complex between *L*-phenylalanine and (2*S*,3*R*) receptor **1**. Comparison with experimental ECD spectra reveal that this absolute configuration corresponds to (+) receptor **1**.

**Figure S38. Modelling studies of associates between receptor 1 and *L*-phenylalanine.**

All calculations were performed using Gaussian09 software.<sup>1</sup> Since it does not participate in the complex formation and in order to keep the calculations within reasonable limits, the bromine atom in the catalyst structure was substituted by a hydrogen atom. Geometry optimizations were performed using M06-2X DFT functional<sup>2</sup> and 6-31G\*\* basis set<sup>3</sup> in the gas phase. Gibbs free energy correction at 298.15 K was calculated with this method and corrected according to the so-called “quasi-harmonic approach” using a free-rotor approximation for vibrational modes below 100 cm<sup>-1</sup> and a rigid rotor approximation above this cutoff.<sup>4</sup> Single point energy was calculated on the optimized structures using M06-2X DFT functional<sup>2</sup> and 6-311+G\*\* basis set. Solvent (chloroform) was modeled in this single-point calculation using SMD solvation model.<sup>5</sup> The Gibbs free energy of each structure is calculated adding to this single point energy the  $\Delta G$  correction term calculated as described above.
