Analysis of the distortion energy as described in the literature.[25]

Following an approach similar to that described by Lopez and Houk,[25] we calculated the electronic energies of the four TS structures **TS-3a** shown in Scheme 5, as well as the electronic energies of the ylide **2** and the two isomers of intermediate **Int-2a** (Scheme 5). The TS optimized structures were broken in the respective reagents (ylide and **Int-2a**), and single-point electronic energies have been calculated. The distortion energies have been calculated as the difference between the sum of the electronic energies of the optimized structures of ylide **2** and intermediate **Int-2a**, either in *cis* or *trans* conformations, and the sum of the electronic energies of their respective distorted structures, as obtained from the transition states.

The difference of electronic energy between **TS-3a** (SS) and **TS-3a** (SR) is 6.60 kJ mol⁻¹ (a value similar to the difference in free energy - 4.07 kJ mol⁻¹, Scheme 5), and the difference of strain energy calculated between the structures resulting from **TS-3a** (SS) and **TS-3a** (SR) is 5.30 kJ mol⁻¹ (Figure S2). These results clearly indicate that the difference in activation energy between

TS-3a (SS) and **TS-3a (SR)** mainly results from the increment of energy that is needed to distort the ylide and the iminium intermediate from their relaxed conformations to the conformations they have to adopt in the transition state. A similar conclusion is obtained from the comparison between **TS-3a (RS)** and **TS-3a (RR)**, as their difference in electronic energy is $10.92 \text{ kJ mol}^{-1}$, and their difference in strain energy if 7.25 kJ mol^{-1} .

A similar study applied to structures **TS-4a** is not possible, due to the C-S bond cleavage that occurs during this type of TS.

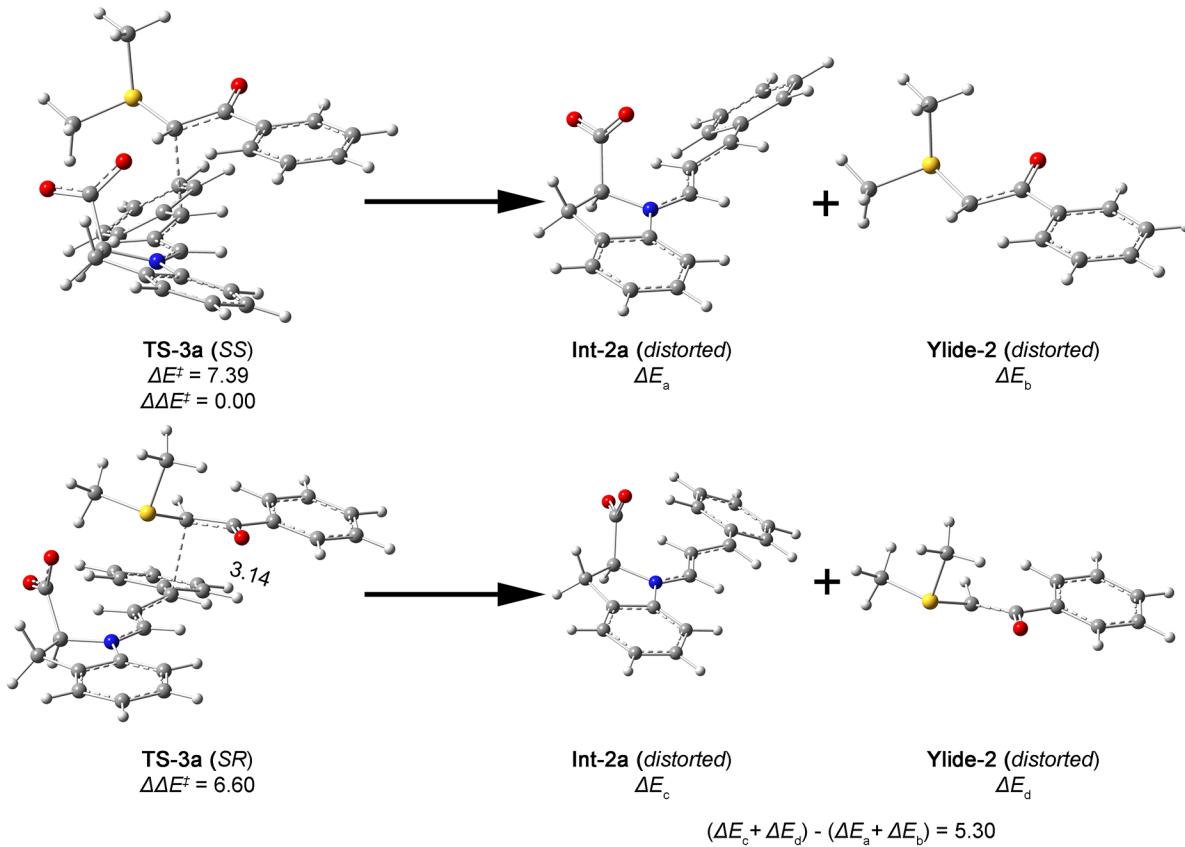

Figure S2. Comparison between the difference in activation energy between **TS-3a (SR)** and **TS-3a (SS)** and the difference in strain energy between the distorted fragments obtained from the respective transition structures. Electronic energies, in kJ mol^{-1} , were calculated with B2PLYP/6-311+G**. The activation energy of **TS-3a (SS)** is relative to the energy of the pre-complex in Figure 7.
