${ }^{1} \mathrm{H}$ - and ${ }^{13} \mathrm{C}-\mathrm{NMR}$ spectra were recorded on Bruker 300, 400, 500, and 600 MHz spectrometers and were referenced to residual solvent: $\mathrm{CDCl}_{3}\left({ }^{1} \mathrm{H}-\mathrm{NMR}: 7.26 \mathrm{ppm}\right.$; and $\left.{ }^{13} \mathrm{C}-\mathrm{NMR} 77.00 \mathrm{ppm}\right) ; \mathrm{CD}_{3} \mathrm{CN}\left({ }^{1} \mathrm{H}-\mathrm{NMR}: 1.94\right.$ ppm and $\left.{ }^{13} \mathrm{C}-\mathrm{NMR}: 1.39 \mathrm{ppm}\right)$; $\left(\mathrm{CD}_{3}\right)_{2} \mathrm{CO}\left({ }^{1} \mathrm{H}-\mathrm{NMR}: 2.05 \mathrm{ppm}\right.$ and $\left.{ }^{13} \mathrm{C}-\mathrm{NMR}: 29.84 \mathrm{ppm}\right)$; DMSO- $\mathrm{d}_{6}\left({ }^{1} \mathrm{H}-\right.$ NMR: 2.50 ppm and ${ }^{13} \mathrm{C}-\mathrm{NMR}: 39.52 \mathrm{ppm}$ ); or $\mathrm{CD}_{2} \mathrm{Cl}_{2}$ ( ${ }^{1} \mathrm{H}-\mathrm{NMR}: 5.31 \mathrm{ppm}$ and ${ }^{13} \mathrm{C}-\mathrm{NMR}: 54.00 \mathrm{ppm}$ ). Routine ESI-MS were recorded on a ThermoFinnigan Surveyor MSQ detector and hi-resolution MS measurements were performed by the Universität Zürich Mass Spectrum Facility. All experiments were carried out under normal atmosphere in reagent grade solvents unless otherwise noted. Commercial chemicals were used as supplied from Aldrich or Acros Chemical Co. Column chromatography was performed on neutral aluminum oxide (Brockmann III) and silica gel (230-425 mesh). Melting points are uncorrected and recorded on a Mel-Temp Laboratory Device. Dichlorotetrakis (dimethyl sulphoxide) ruthenium(II), ${ }^{1}$ dichloro (1,5-cyclooctadien) platinum(II), ${ }^{2}$ (2-trimethylsilyl- ethynyl) tributylstannane, ${ }^{3} 5,5$ "-bromo- 2,2':6':2"-terpyridine, ${ }^{4}$ 5,5"-bis-(4-methoxy-2,6-dimethyl-phenyl)- 2,2':6',2"-terpyridine, 5,5"-bis-(4-hydroxy-2,6-dimethyl-phenyl)-2,2':6',2"- terpyridine, 5,5"-bis-(4-methoxy-2,6-dimethyl-phenyl)- 2,2':6',2"terpyridine, 5,5'-bis-(4-methoxy- 2,6-dimethyl-phenyl)-2,2'-bipyridine,5 4,4"-bis- (4-hydroxy- 2,6-dimethyl-phenyl)- 2,2':6',2"-terpyridine macrocycle 1 and Ru[4,4"-bis-(4-hydroxy-2,6-dimethyl-phenyl)-2,2':6',2"terpyridine] $\mathrm{Cl}_{3},{ }^{6}$ were prepared according to literature procedures.

Single crystal diffraction measurements for 1a, 1b', and 2 were made on a Nonius KappaCCD areadetector diffractometer ${ }^{7}$ using graphite-monochromated Mo Ka radiation ( $\lambda=0.71073 \AA$ ) and an Oxford Cryosystems Cryostream 700 cooler. Diffraction data for 2-terpy were recorded on a protein beamline at the Swiss Light Source where only a single phi scan was possible. Complete crystallographic data, in CIF format, have been deposited with the Cambridge Crystallographic Data Centre. CCDC 1437407-1437409 and 1432774 contain the supplementary crystallographic data for this paper. These data can be obtained free of charge from The Cambridge Crystallographic Data Centre via www.ccdc.cam.ac.uk/getstructures. All images were generated with PyMOL. ${ }^{8}$

The brown-red solution was dried over magnesium sulfate, filtered and solvent evaporated to yield a brown solid ( $0.020 \mathrm{~g}, 99 \%$ ). m.p. $>350{ }^{\circ} \mathrm{C}$; ESI-MS: $m / z$ for $[\mathrm{M}-4 \mathrm{Cl}+4 \mathrm{ACN}]^{6+}$ calc. 564.8 , found $565.3 ; \mathrm{m} / \mathrm{z}$ for $[\mathrm{M}-3 \mathrm{Cl}+3 \mathrm{ACN}]^{5+}$ calc. 676.6 , found 676.6; $\mathrm{m} / \mathrm{z}$ for $[\mathrm{M}]^{4+}$ calc. 841.2, found 840.6.

Prepared using an analogous literature procedure. ${ }^{2}$ Solid silver(I)tertrafluoroborate ( $0.003 \mathrm{~g}, 1.59 \times 10^{-5}$ moles) was added to solution of dichloro (1,5-cyclooctadiene)-platinum(II) ${ }^{11}$ ( $0.003 \mathrm{~g}, 7.55 \times 10^{-6} \mathrm{moles}$ ) in acetone $(0.250 \mathrm{~mL})$ and the solution filtered through a celite pad into a solution of two ring complex 1 ( 0.013 $\mathrm{g}, 3.68 \times 10^{-6}$ moles) in acetonitrile ( 1.0 mL ). The red solution was stirred for 30 min at room temperature before adding a $10 \%$ solution of hydrochloric acid to cause a red precipitate. The precipitate was filtered over celite, washed with water and diethyl ether and dissolved into a clean flask with acetonitrile. Aqueous potassium hexafluorophosphate was added until a deep red precipitate formed and the precipitate was filtered over celite, washed with water and diethyl ether and dissolved into a clean flask with acetonitrile.
