General Information:

All solvents were purified according to standard methods prior to use. Purifications of reaction products were carried out by chromatography using silica gel (200-300 mesh). Melting points were recorded on a BÜCHI B-540 melting point apparatus. NMR spectra were recorded for ^1H NMR at 500 MHz and for ^{13}C NMR at 125 MHz. For ^1H NMR, tetramethylsilane (TMS) served as internal standard ($\delta=0$) and data are reported as follows: chemical shift, integration, multiplicity (s = singlet, d = doublet, t = triplet, q = quartet, m = multiplet), and coupling constant(s) in Hz. For ^{13}C NMR, TMS ($\delta=0$) or CDCl_3 ($\delta=77.26$) was used as internal standard and spectra were obtained with complete proton decoupling. HPLC analysis and the HRMS of all final products were confirmed on a Agilent 1290 HPLC-6224 Time of Flight Mass Spectrometer using PhenomenexLuna 5μ C18, 100 Å, 150 X 4.60 mm 5 micron column at a flow rate of 0.5 mL/min using liner gradients buffer B in A (B: CH_3OH containing 0.1 % formic acid, A: H_2O containing 0.1% formic acid). Mobile phase B was increased linearly from 5% to 95% over 7 min and 95% over the next 2 min, after which the column was equilibrated to 5% for 1 min. Vinyl azides **1** were readily prepared from the corresponding olefins by successive reaction with bromine then with sodium azide. ^[1]

General Procedure for the Synthesis of 6:

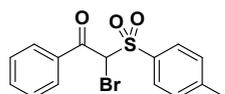

A mixture of vinyl azide **1** (1.0 mmol), sulfonylhydrazide **2** (2.0 mmol, 2.0 equiv.), KI (0.4 mmol, 0.4 equiv.), KBr (1.0 mmol, 1.0 equiv.) and TBHP (4.0 mmol, 70% in

water) was stirred in DMSO (2.0 mL) at room temperature (25 °C) for 6.0-8.0 h. The reaction mixture was quenched with water (10 mL), and then extracted three times with EtOAc. The combined organic extracts were washed with brine, dried over MgSO₄ and concentrated. Purification of the crude product by chromatography to afford **6a-6h**.
