Experimental

Computational Methods

PLS allows to find relationships between the VolSurf-derived properties matrix (X matrix) and the response, in this case heat capacity values of ILs.

The PLS algorithm computes PLS components for each of the two matrices (X and Y matrices), searching simultaneously for a linear relationship between the X-scores and Y-scores of the PLS components by means of equation (1), where b_a is a proportionality coefficient:

$$y_{ia} = \sum_{i=1}^A b_a t_{ia} + h_{ia} \quad (1)$$

The main statistical parameters provided by the PLS method [29] are R^2X , R^2Y (respectively sum of squares of all the X's and Y's explained by all extracted components) and Q^2 , the fraction of the total variation of the Y's predicted by all PLS components, as estimated by cross validation (CV). Q^2 was computed as: $1 - \text{PRESS}/\text{SS}$, where SS is the residual sum of squares and PRESS is the squared difference between observed and predicted values for the data kept out of the model fitting. CV was performed in the same way than for PCA.

The statistical results obtained by the PLS method are able to detect what variables in the X block are relevant to determine the dependent variables (Y block) by means of the VIP values. SIMCA computes VIP values by summing over all model dimensions the contributions VIN (variable influence). For a given PLS dimension, a , $(\text{VIN})_{ak}^2$ is equal to the squared PLS weight $(w_{ak})^2$ of that term, multiplied by the % explained of residual sum of squares by that PLS dimension. The accumulated (over all PLS dimensions) value, $\text{VIP}_k = \sum (\text{VIN})_k^2$ is then divided by the total percent explained of residual sum of squares by the PLS model and multiplied by the number of terms in the model.

Figure S1. Permutation plots

In PLS Q^2 assesses the predictive power of the model and a permutation plot is a further chemoinformatic tool to check the significance of a PLS model and the reliability of its Y-predictions. In fact the purpose of this validation tool is to compare the goodness of fit (R^2 and Q^2) of the original model with the goodness of fit of several models based on data where the order of the Y-observations has been randomly permuted, while the X-matrix has been kept intact. The permutation plot [32] below shows R^2 and Q^2 values on the vertical axis for the parental PLS model (far to the right) and the Y-permuted models parameters on the left. The horizontal axis shows the correlation between the permuted Y-vectors and the original Y-vector. The original parameters have correlation 1 with themselves.

In order to have a valid plot, some important criteria are requested:

1. All Q^2 -values on the left should be lower than the original points to the right.
2. The R^2 intercept should be less than 0.4.
3. The regression line of the Q^2 -points should intersect the vertical axis (on the left) at or below zero.

The plot below was obtained by considering 50 random PLS models, and strongly indicates that Cp correlation model can be considered valid.

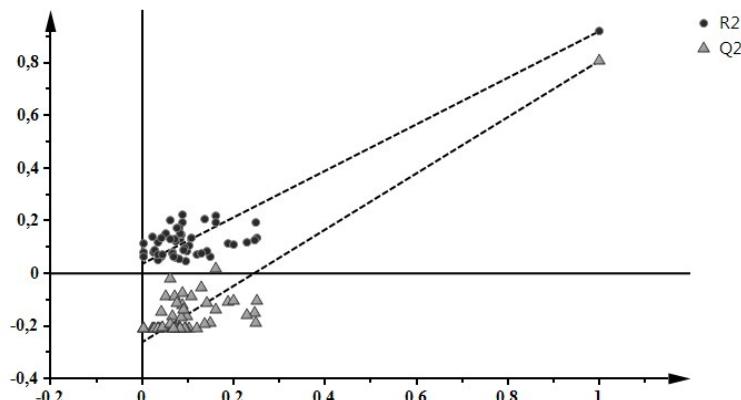

Fig. S1

Synthesis and characterization of test set ILs

Materials

Commercially available compounds were used directly without any preliminary treatment. 1-Butyl-3-methylimidazolium tetrafluoroborate was purchased from Sigma-Aldrich. 1-Butyl-3-methylimidazolium tricyanomethanide, 1-butyl-3-methylimidazolium dimethylphosphate 1-butyl-4-methylpyridinium tricyanomethanide, 1-butyl-4-methylpyridinium chloride and 1-hexyl-3-methylimidazolium chloride were purchased from Io.Li.Tec. Solvents, HBF₄ solution (50/50, w/w) and Amberlite IRA-400 resin were used as purchased without further purification.

Synthesis of 1-butyl-4-methylpyridinium tetrafluoroborate (IL 331). 2 g (10.7 mmol) of 1-butyl-4-methylpyridinium chloride were dissolved in 30 mL of anhydrous CH₂Cl₂ under Argon atmosphere, and 1.17 g (10.7 mmol) of NaBF₄ were added. The solution was stirred for 24h. The suspension was filtered and washed with anhydrous dichloromethane to remove the precipitated sodium chloride salt, then the organic phase was filtered on alumina and charcoal (to remove residual impurities) and washed with small volumes of water. The absence of residual halides was verified by silver nitrate test. The solvent was removed *in vacuo* and no further treatments were needed. The organic salt was recovered with 80.8 % of yield, and the structure confirmed by the NMR spectra in agreement with literature data [34].

Synthesis of 1-butyl-3-methylimidazolium acetate (IL 511) and 1-hexyl-3-methylimidazolium salts (tetrafluoroborate, acetate and trifluoroacetate) (ILs 196, 512, 513). The general procedure for the synthesis of these ionic liquids from the relevant halides is reported below. The Amberlite resin IRA-400 (16 g) was converted from chloride form to hydroxide form by eluting an aqueous solution of NaOH (10 mL, 10% w/v) within a column. Subsequently the resin was washed with water until the eluate was neutral. The halide salt(s) (10 mmol), dissolved in methanol/water (70/30, v/v), was eluted, and the eluate collected into a flask containing a solution of the corresponding acid in stoichiometric amount, until neutralization. The resulting solution was concentrated *in vacuo*, then treated with activated charcoal in ethanol. Filtration and removal of the solvent afforded the ionic liquids as viscous oils in high to quantitative yields. The products structures were confirmed by NMR spectra and are in agreement with literature data [35-38].

1-Hexyl-3-methylimidazolium tetrafluoroborate

Pale yellow oil. Yield: 100%

¹H NMR (300 MHz, CDCl₃): δ=8.70 (s, 1 H), 7.21 (d, J=14 Hz, 2 H), 4.17 (t, J=6 Hz, 2 H), 3.94 (s, 3 H), 1.87 (m, 2 H), 1.31 (m, 6 H), 0.87 (t, J=6 Hz, 3 H) ppm.

¹³C NMR (300 MHz, CDCl₃): δ= 135.8, 123.4, 121.9, 50.0, 36.2, 31.1, 29.0, 25.9, 22.3, 13.8 ppm [34].

1-Hexyl-3-methylimidazolium acetate

Pale yellow oil. Yield: 99%

¹H NMR (300 MHz, d₆-DMSO): δ=9.44 (s, 1 H), 7.74 (d, J=24 Hz, 2 H), 4.15 (t, J=7 Hz, 2 H), 3.85 (s, 3 H), 1.77 (quint, J=6.8 Hz 2 H), 1.56 (s, 3 H), 1.26 (m, 6 H), 0.85 (t, J=7 Hz, 3 H) ppm. ¹³C NMR (300 MHz, d₆-DMSO) δ= 173.8, 137.9, 124.1, 122.0, 49.0, 36.0, 31.1, 30.2, 29.8, 25.9, 24.6, 22.4 ppm [38].

1-Hexyl-3-methylimidazolium trifluoroacetate

Pale yellow oil. Yield: 96%

¹H NMR (300 MHz, d₆-DMSO): δ=9.15 (s, 1 H), 7.74 (d, J=26 Hz, 2 H), 4.13 (t, J=8 Hz, 2 H), 3.82 (s, 3 H), 1.73 (quint, J=8 Hz, 2 H), 1.25 (m, 6 H), 0.85 (t, J=7 Hz, 3 H) ppm. ¹³C NMR (300 MHz, d₆-DMSO): δ= 158.0, 137.2, 124.1, 122.1, 49.24, 36.1, 30.9, 30.2, 29.9, 25.6, 22.3, 14.2 ppm [36].

Heat capacity measurements

The heat capacities were measured by means of DSC analysis carrying out experiments on a Linseis STA PT 1600 instrument at atmospheric pressure. over the temperature ranging from. Samples (20.0 ± 0.1 mg) were heated in a platinum sample boat up. In accordance with Chiu [33] a method was created to hold isothermally at the desired starting temperature (298K) for 10 min, then heating at 5°K/min up to 353°K, then holding at this temperature for 10 min. The purge gas used was nitrogen with a flow rate of 50 cc/min. Water was used as standard to check the heat capacity measurements according to the method reported by Chiu [33].

Cp values measured in the present work are in excellent agreement with values reported in the literature (see Table 1), with differences of 6%, 5% and 2% for ILs 511, 196 and 331 respectively.

Table S1. Cp PLS predictions. DModX values higher than 1.60 corresponding to 95% c.l. [32] marked in red indicate a high distance from the learning set domain.
