After adjustment of the approach given in ref.<sup>1</sup> (by inclusion of the factor of 12), the deviation ( $D$ ) of the metal coordination from perfectly octahedral can be estimated as

$$D = \frac{\sum |\theta - 90|}{90} \times 100\%,$$

where  $\theta$  are the values of the twelve *cis*-angles in the MD<sub>6</sub> chromophore.

Alternatively, an RMS value can be used:

$$D = \frac{\sqrt{\frac{\sum (\theta - 90)^2}{12}}}{90} \times 100, \text{ which gives 4.2 \% for the Co}^{\text{II}} \text{ ion in } \mathbf{1}.$$

Table S1. The values of Co–O(water)–Co angles in aqua- and diaqua- bridged Co<sup>II</sup> complexes.
