

SUPPLEMENTARY INFORMATION

Table S1: The inhibition effectiveness of different organic corrosion inhibitors for aluminium and different aluminium alloys in various solutions. The inhibition effectiveness values are reported as given in the article or calculated from the corrosion rate, corrosion current/current density, or resistance given in the article. In instances where different techniques were used for the determination of the inhibition effectiveness, the range from the minimum to the maximum values reported in the article is reported below in this table.

* η was calculated based on the values of the corrosion rate, corrosion current, or corrosion current density or the resistance of the blank solution and inhibited samples.

** η was calculated based on the sum ($R_{\text{oxide}} + R_p + R_{\text{inhibitor}}$) of the blank solution and of the inhibited samples.
