## **1. General details**

Reaction solvents were obtained commercially, and used without further purification. Commercial reagents were used as received. Reactions were monitored by thin-layer chromatography (TLC) on 0.25mm precoated Merck Silica Gel 60 F254, visualizing with ultraviolet light.  $^1\text{H}/^{13}\text{C}$  NMR spectra were recorded on 400/54 ascend purchased from Bruker Biospin AG, operating at 400/100 MHz, respectively. Chemical shifts ( $\delta$ ) are reported in parts per million (ppm) downfield from tetramethylsilane (TMS), which was used as internal standard. Flash column chromatography was performed on Merck Silica Gel 60 (200-300mesh) using petroleum ether and ethyl acetate.

## **2. Experimental procedure**

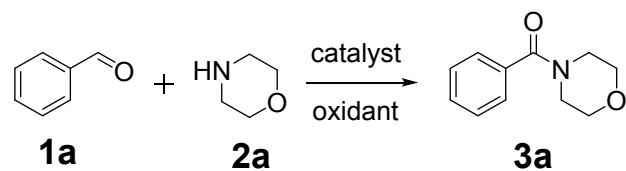

### **2.1. General procedure for synthesis of compound 3a by benzaldehyde with morpholine**

0.01mol of benzaldehyde,  $\text{H}_2\text{O}_2$  (30wt% in water, 0.04mol, 2eq), NaBr (5 mol%) and  $\text{H}_2\text{SO}_4$  (1 mol%) were dissolved in 30mL dioxane, which was in syringe A. Morpholine (0.02mol, 2eq) was dissolved in 30mL dioxane, which was in syringe B. The flow rates of syringe A and B were both 0.1mL/min. And the temperature of the oil bath was set at 80°C. The reaction liquid was collected, and dissolved in ethyl acetate, washed with  $\text{H}_2\text{O}$ . The organic layer was dried over anhydrous sodium sulfate and solvent was removed under vacuum. And the crude product was purified by flash chromatography on silica gel by gradient elution with ethyl acetate in petroleum ether to obtain the amide product **3a**.

### **2.2. General procedure for synthesis of compound 3a by benzyl alcohol with morpholine**

0.01mol of benzyl alcohol, morpholine (0.02mol, 2eq) were dissolved in 30mL dioxane, which was in syringe A. And  $\text{H}_2\text{O}_2$  (30wt% in water, 0.05mol, 5eq), NaBr (10 mol%) and  $\text{H}_2\text{SO}_4$  (1 mol%) were dissolved in 30mL dioxane, which was in syringe B. The flow rates of syringe A and B were both 0.1mL/min. And the temperature of the oil bath was set at 80°C. The reaction liquid was collected, and dissolved in ethyl acetate, washed with  $\text{H}_2\text{O}$ . The organic layer was dried over anhydrous sodium sulfate and solvent was removed under vacuum. And the crude product was purified by flash chromatography on silica gel by gradient elution with ethyl acetate in petroleum ether to obtain the amide product **3a**.
