1. General Methods

Fresh double distilled water was used throughout the experiment. All other reagents and solvents were commercially available at analytical grade and were used without further purification. ^1H NMR and ^{13}C NMR spectra were recorded on an Agilent DD2 at 600 MHz spectra. ^1H chemical shifts are reported in ppm downfield from tetramethylsilane (TMS, δ scale) with the solvent resonances as internal standards. UV–visible spectra were recorded on a Shimadzu UV–2550 spectrometer. Photoluminescence spectra were performed on a Shimadzu RF–5301 fluorescence spectrophotometer. Melting points were measured on an X–4 digital melting-point apparatus. The infrared spectra were performed on a Digilab FTS–3000 FT–IR spectrophotometer.

All the UV–vis experiments were carried out in DMSO on a Shimadzu UV–2550 spectrometer. Any changes in the UV–vis spectra of the synthesized compound kept the ligand concentration constant (2.0×10^{-5} M) in all experiments. Tetrabutylammonium salt (1.0×10^{-3} M) of anions (F^- , Cl^- , Br^- , I^- , AcO^- , H_2PO_4^- , HSO_4^- and ClO_4^-) and sodium salt (1.0×10^{-3} M) of anions (CN^- and SCN^-) were used for the UV–vis experiments.

All the fluorescence spectroscopy was carried out in DMSO on a Shimadzu RF–5301 spectrometer. Any changes in the fluorescence spectra of the synthesized compound kept the ligand concentration constant (2.0×10^{-5} M) in all experiments. Tetrabutylammonium salt (1.0×10^{-3} M) of anions (F^- , Cl^- , Br^- , I^- , AcO^- , H_2PO_4^- , HSO_4^- and ClO_4^-) and sodium salt (1.0×10^{-3} M) of anions (CN^- and SCN^-) were used for the fluorescence experiments

For ^1H –NMR titrations, the solution of **HY** was prepared in $\text{DMSO}-d_6$ and the appropriate concentrated solution of guest was prepared in $\text{DMSO}-d_6$. Aliquots of the two solutions were mixed directly in NMR tubes.

2. Synthesis of sensor molecule **HY**

The synthesis route of sensor **HY** is demonstrated in Scheme 1. An ethanol solution (25 mL) of 4-(Diethylamino)salicylaldehyde (0.966 g, 5 mmol), isonicotinyl hydrazide (0.685 g, 5 mmol) were stirred under reflux 4h. After cooling to room temperature, the yellow precipitate was filtered, washed with hot absolute ethanol three times, then recrystallized with ethanol to get yellow product **HY** in 88% yield. m. p 193°C-196°C. ¹H NMR (DMSO-d₆, 400 MHz) δ: 11.98 (s, 1H), 11.25 (s, 1H), 8.76 (dd, 2H), 8.43 (s, 1H), 7.80(dd, 2H), 7.22 (d, 1H), 6.26 (dd, 1H), 6.11 (d, 1H), 3.35 (q, 4H), 1.09 (t, 6H); ESI-MS m/z: Calcd for [C₁₇H₂₀N₄O₂ + H]⁺ 313.16; Found [C₁₇H₂₀N₄O₂ + H]⁺ 313.20.

Scheme S1 Synthesis of the sensor compound **HY**.

3. ^1H NMR spectrum of HY

Fig. S1 ^1H -NMR spectrum of HY in $\text{DMSO}-d_6$.

4. ^{13}C NMR spectrum of HY

Fig. S2 ^{13}C -NMR spectrum of **HY** in $\text{DMSO-}d_6$.

5. Mass spectrum of HY

Fig. S3 Mass spectrum of HY.

6. Determination of Detection Limit

Fig. S4 The photograph of the fluorescent spectrum linear range.

Linear Equation: $Y = 92.24781 \times X - 80.2359$ $R = 0.98801$

$$S = 9.225 \times 10^7 \quad \delta = \sqrt{\frac{\sum(F - F)^2}{(N - 1)}} = 1.603 \quad (N = 10) \quad K = 3$$

$$\text{LOD} = K \times \delta/S = 5.21 \times 10^{-8} \text{ M}$$

7. The UV-vis and fluorescence spectra of HY adding F^- , Cl^- , Br^- , I^- , AcO^- , $H_2PO_4^-$, HSO_4^- , ClO_4^- , CN^- and SCN^- dissolved in pure water (50 equiv.) in the DMSO/ H_2O (v/v = 7:3) solution ($\lambda_{ex}=375$ nm)

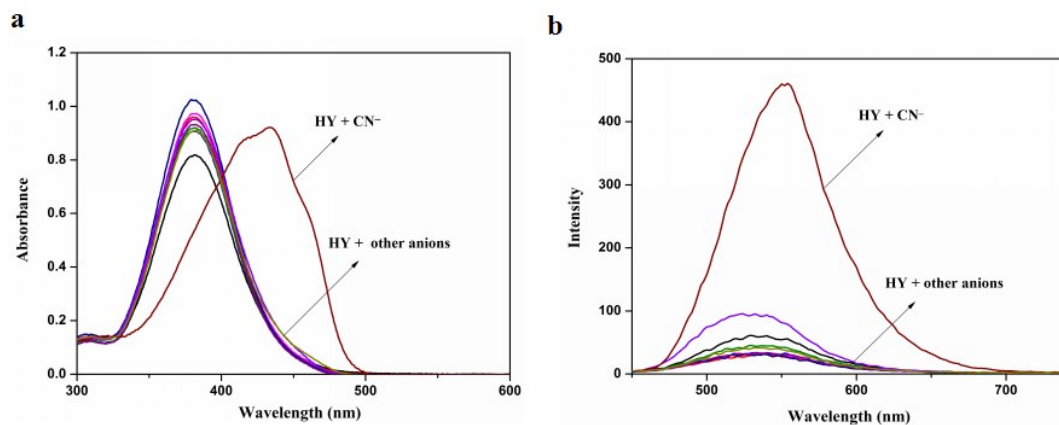

Fig. S5 a) Absorbance spectra data b) Fluorescence emission data of **HY** adding F^- , Cl^- , Br^- , I^- , AcO^- , $H_2PO_4^-$, HSO_4^- , ClO_4^- , CN^- and SCN^- dissolved in pure water (50 equiv.) in the DMSO/ H_2O (v/v = 7:3) solution ($\lambda_{ex}=375$ nm).

8. Mass spectrum change of $\text{HY} + \text{CN}^-$.

Fig. S6 Mass spectrum change of $\text{HY} + \text{CN}^-$.

9. Effect of pH the UV-vis and fluorescence spectra of HY + CN⁻.

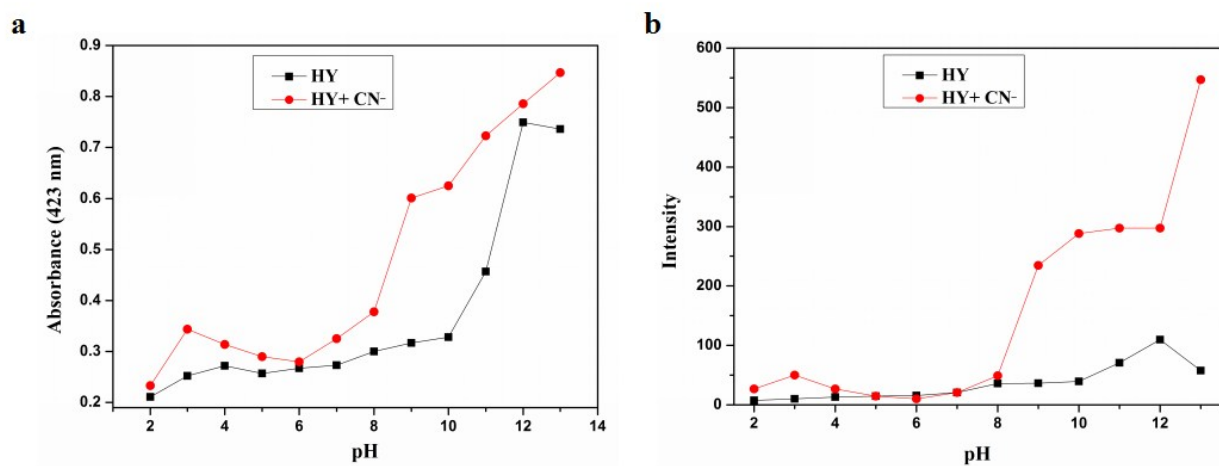

Fig. S7 Effect of pH on the a) UV-vis and b) Fluorescence spectra of **HY** (2.0×10^{-5} M) in

response to CN⁻ (50 equiv.) from 2 to 13 in DMSO/H₂O (v/v=7:3) solution.

10. A part of the literatures were provided in the followed table:

Table S1:

Journal Year. Volume. Page	Response channel	Water content	Detection limits	Application	single crystal data
This work	Colorimetric and fluorometric (Off-On)	DMSO/H ₂ O (v/v = 7:3).	Fluorometric: 5.21 × 10 ⁻⁸ M	a) INHIBIT molecular logic gates; b) test trips; c) detection in food sample	Yes
Organic Letters 15 (2013) 2386–2389	Fluorometric (Off-On)	DMSO/H ₂ O (v/v = 99:1)	—	—	—
Talanta 152 (2016) 39–44	Colorimetric and fluorometric (Off-On)	DMSO/buffer (v/v = 9:1)	—	—	Yes
New J. Chem.39 (2015) 4041–4046	Colorimetric and fluorometric (Off-On)	DMSO/H ₂ O (v/v = 3:2)	1.2 × 10 ⁻⁹ M	test trips	—
Tetrahedron 72 (2016) 1244–1248	Colorimetric and fluorometric (Off-On)	THF/H ₂ O (v: v = 99:1)	—	—	—
Tetrahedron 70 (2014) 1889–1894	Colorimetric and fluorometric (Off-On)	DMSO/H ₂ O (v/v = 9:1)	4.0 × 10 ⁻⁷ M	—	Yes
