

Table SM1. EDXRF analyses of CSAC and MCSAC

| Element | CSAC | MCSAC |
|---------|-------------|------------|
| P | 2.62% | 6.757% |
| K | 939.76 ppm | 958.69 ppm |
| Ca | 1518.87 ppm | 0.31 % |
| Fe | 0.405 ppm | 92.58 % |
| Cu | - | - |
| Zn | 0.21% | - |
| Cl | - | 0.25% |

Table SM2. Description of equations used in the Manuscript

| Equation/model name | Mathematical expression | Parameters | Equation no. |
|---|---|---|---------------------|
| Helium density (ρ_{He}) measurement | $\rho_{Hg} = M/V_s$ | M is the mass of sample, and V_s is the sample volume | SM1 |
| | $\rho_{He} = M/V'_s$ | M is the mass of sample, V'_s is the sample volume inaccessible to helium. | SM2 |
| Dubinin-Radushkevich equation | $\log W = \log W_0 - D \log^2 \left(\frac{p^0}{p} \right)$ | W stands for micropore volume filled with liquid N_2 when the relative pressure is p/p^0 and W_0 is the total micropore volume. D stands for a characteristic constant for the microporous structure of the adsorbent | SM3 |
| Total pore volume (V_T) | $V_T = \frac{1}{\rho_{Hg}} - \frac{1}{\rho_{He}}$ | ρ_{Hg} and ρ_{He} are mercury and helium densities | SM4 |
| Pseudo-first-order rate equation (linear) | $\ln \left(\frac{q_e - q_t}{q_e} \right) = -k_1 t$ | q_e is the equilibrium adsorption capacity, q_t is the adsorption capacity at time 't', k_1 is the rate constant, t is time | SM5 |
| Pseudo-first-order rate equation (non-linear) | $q_t = q_e (1 - e^{-k_1 t})$ | q_e is the equilibrium adsorption capacity, q_t is the adsorption capacity at time 't', k_1 is the rate constant, t is time | SM6 |

| | | | |
|--|---|--|-------------|
| Pseudo-second-order rate equation (linear) | $\frac{t}{q_t} = \frac{1}{k_2 q_e^2} + \frac{t}{q_e}$ | t = time, k_2 is pseudo-second-order adsorption rate constant ($\text{g mg}^{-1} \text{min}^{-1}$), q_e is the amount of 2-NP adsorbed at equilibrium and q_t the amount of 2-NP adsorbed at time “t”. | SM7 |
| Freundlich isotherm model | $q_e = K_F C_e^{1/n}$ | q_e is the 2-NP amount adsorbed per unit weight of adsorbent (mg/g), K_F and $1/n$ are constants, C_e is the equilibrium 2-NP concentration | SM8 |
| Langmuir isotherm model | $Q_e = \frac{Q^0 b C_e}{1 + b C_e}$ | q_e is the 2-NP amount adsorbed per unit weight of adsorbent (mg/g), C_e is the 2-NP equilibrium concentration in solution (mg/L), Q^0 is the monolayer adsorption capacity (mg/g) and constant b is related to the net enthalpy, H , of adsorption ($b \propto e^{-\Delta H/RT}$). More precisely, “ b ” is the reciprocal of concentration at which half saturation is attained. | SM9 |
| Sips isotherm model | $Q_e = \frac{K_{LF} C_e^{n_{LF}}}{1 + (a_{LF} C_e)^{n_{LF}}}$ | K_{LF} , a_{LF} and n_{LF} are the Sips constants | SM10 |

Table SM3. Fixed-bed column parameters and equations used for 2-NP removal by CSAC

| Equation | Parameters | Equation No. |
|--|---|--------------|
| $t_x = \frac{V}{F_m}$ | F_m is the mass flow rate expressed as mass per unit cross-sectional bed | SM11 |
| $t_\delta = \frac{\bar{V}_x - \bar{V}_b}{F_m}$ | \bar{V}_x , is the total effluent mass quantity per unit adsorbent area when adsorbent is approaching saturation, \bar{V}_b is total effluent mass quantity per unit adsorbent area at breakpoint, F_m is the mass flow rate expressed as mass per unit cross-sectional bed | SM12 |
| $\frac{\delta}{D} = \frac{t_\delta}{t_x - t_b}$ | D is the ratio of carbon bed depth, t_b is the time required for initial PAZ formation, t_δ is the time required for the zone moving down to its own length in the column, t_x is the total time consumed by the primary adsorption zone establishment | SM13 |
| $f = 1 - \frac{t_b}{t_\delta}$ | f is the fractional capacity | SM14 |
| $\delta = D \left(1 - \frac{t_b}{t_x} \right)$ | δ is the length of the primary adsorption zone, D is the ratio of carbon bed depth, t_x is the total time consumed by the primary adsorption zone establishment | SM15 |
| Percent Saturation = $\frac{D + \delta(f - 1)}{D} * 100$ | - | SM16 |
| Bed Volume = $\frac{\text{Weight of Carbon (Kg)}}{\text{Carbon bulk density (Kg/m}^3\text{)}}$ | - | SM17 |
| EBCT = $\frac{\text{Bed volume}}{\text{Flow rate}}$ | - | SM18 |
| Carbon usage rate (Kg/L) = $\frac{\text{Weight of carbon in columg (g)}}{\text{Volume of breakthrough (L)}}$ | - | SM19 |

Figure SM1. Hysteresis loops of CSAC and MCSAC at 5 and 300 K.

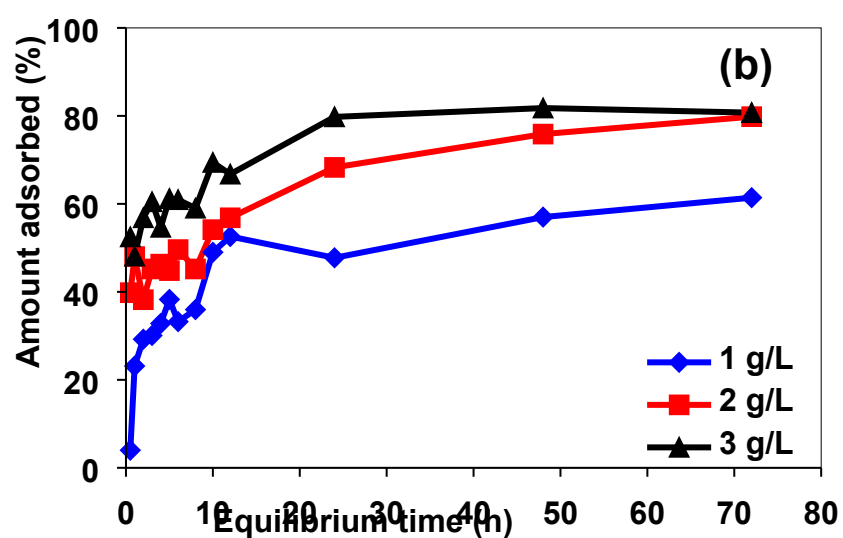

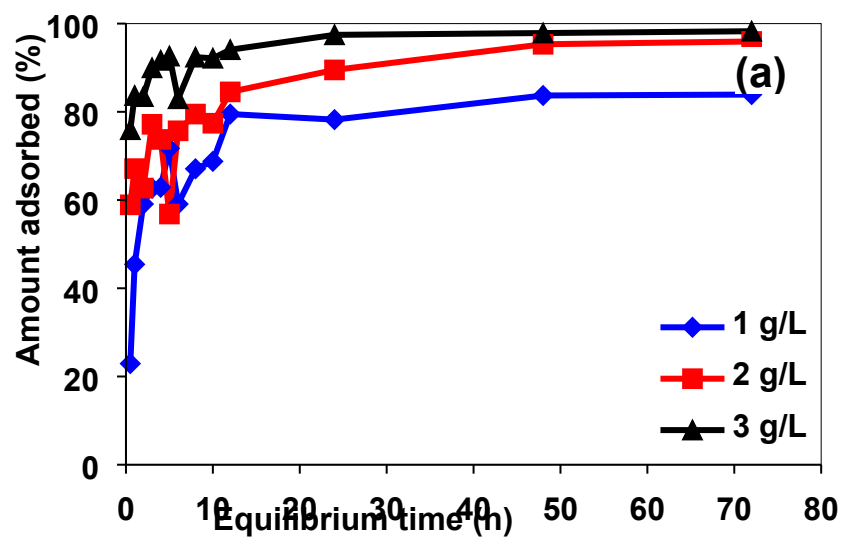

Figure SM2. Effect of adsorbent dose on 2-NP adsorption by (a) CSAC and (b) MCSAC [pH 4.0; 2-NP concentration= 1×10^{-3} M; temperature= 25 °C; particle size= 50-100 B.S.S mesh]

Figure SM3. Effect of temperature on 2-NP adsorption by (a) CSAC and (b) MCSAC [pH 4.0; 2-NP concentration= 1×10^{-3} M; adsorbent dose= 2 g/L; particle size= 50-100 B.S.S mesh]

Figure SM4. Pseudo-second-order kinetic plots for 2-NP removal by (a) CSAC and (b) MCSAC at adsorbent dose [initial 2-NP concentration = 1×10^{-3} M; pH = 4.0, adsorbent dose = 2 g/L; particle size = 50-100 B.S.S. mesh]

Figure SM5. Pseudo-second-order kinetic plots for 2-NP removal by (a) CSAC and (b) MCSAC at different temperatures [initial 2-NP concentration = 1×10^{-3} M; pH = 4.0, adsorbent dose = 2 g/L; particle size = 50-100 B.S.S. mesh]

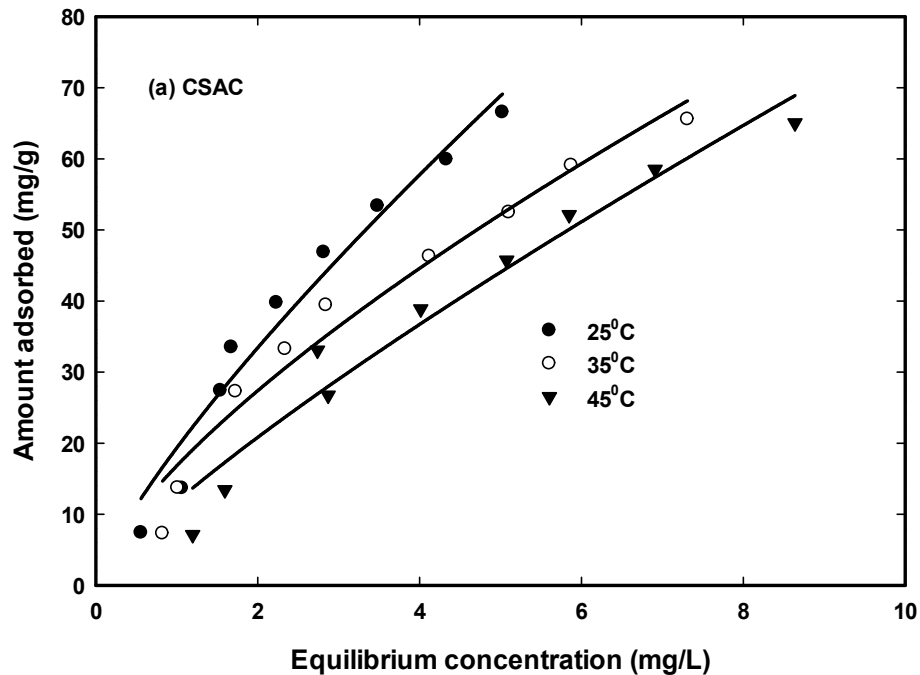

Figure SM6. Freundlich adsorption isotherm of 2-NP by CSAC at different temperatures [pH= 4.0; initial 2-NP concentration range= 1×10^{-4} - 1×10^{-3} M; adsorbent concentration= 2 g/L; particle size= 50-100 B.S.S. mesh]

Figure SM7. Redlich Peterson adsorption isotherm of 2-NP by CSAC at different temperatures [pH= 4.0; initial 2-NP concentration range= 1×10^{-4} - 1×10^{-3} M; adsorbent concentration= 2 g/L; particle size= 50-100 B.S.S. mesh]

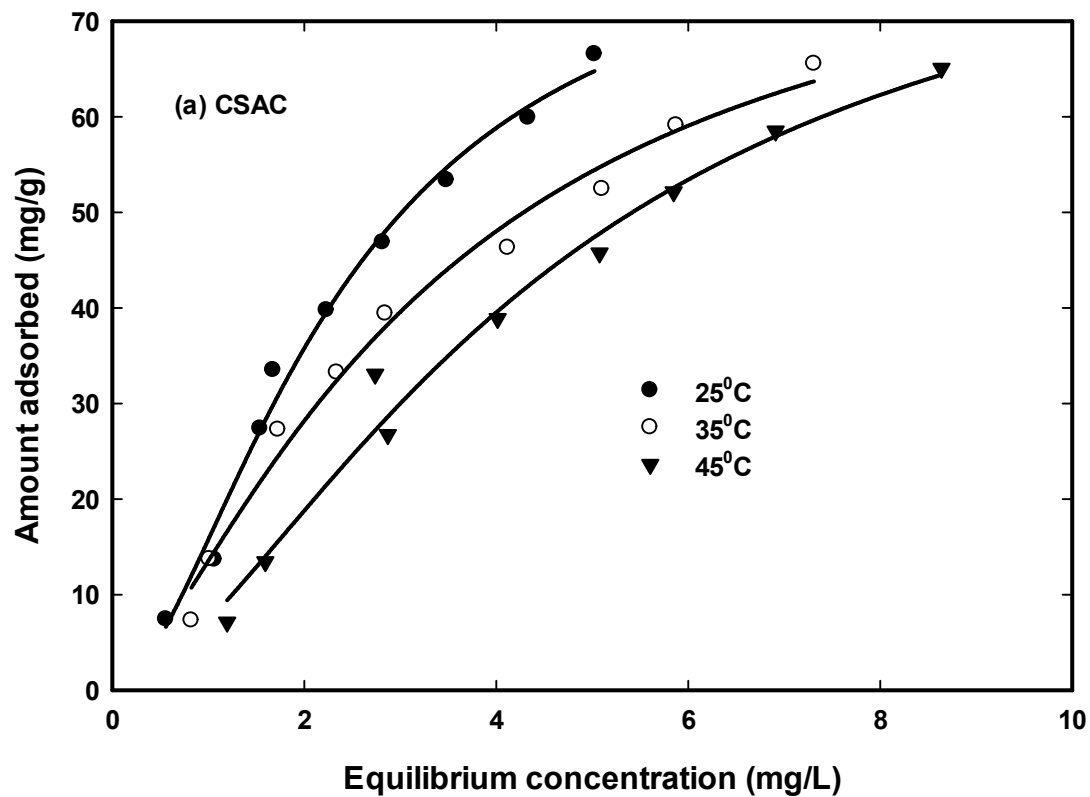

Figure SM8. Koble adsorption isotherm of 2-NP by CSAC at different temperatures [pH= 4.0; initial 2-NP concentration range= 1×10^{-4} - 1×10^{-3} M; adsorbent concentration= 2 g/L; particle size= 50-100 B.S.S. mesh]

Figure SM9. Total adsorption isotherm of 2-NP by CSAC at different temperatures [pH= 4.0; initial 2-NP concentration range= 1×10^{-4} - 1×10^{-3} M; adsorbent concentration= 2 g/L; particle size= 50-100 B.S.S. mesh]

Figure SM10. Temkin adsorption isotherm of 2-NP by CSAC at different temperatures [pH= 4.0; initial 2-NP concentration range= 1×10^{-4} - 1×10^{-3} M; adsorbent concentration= 2 g/L; particle size= 50-100 B.S.S. mesh]
