### *Detailed parameters in the kinetic calculations*

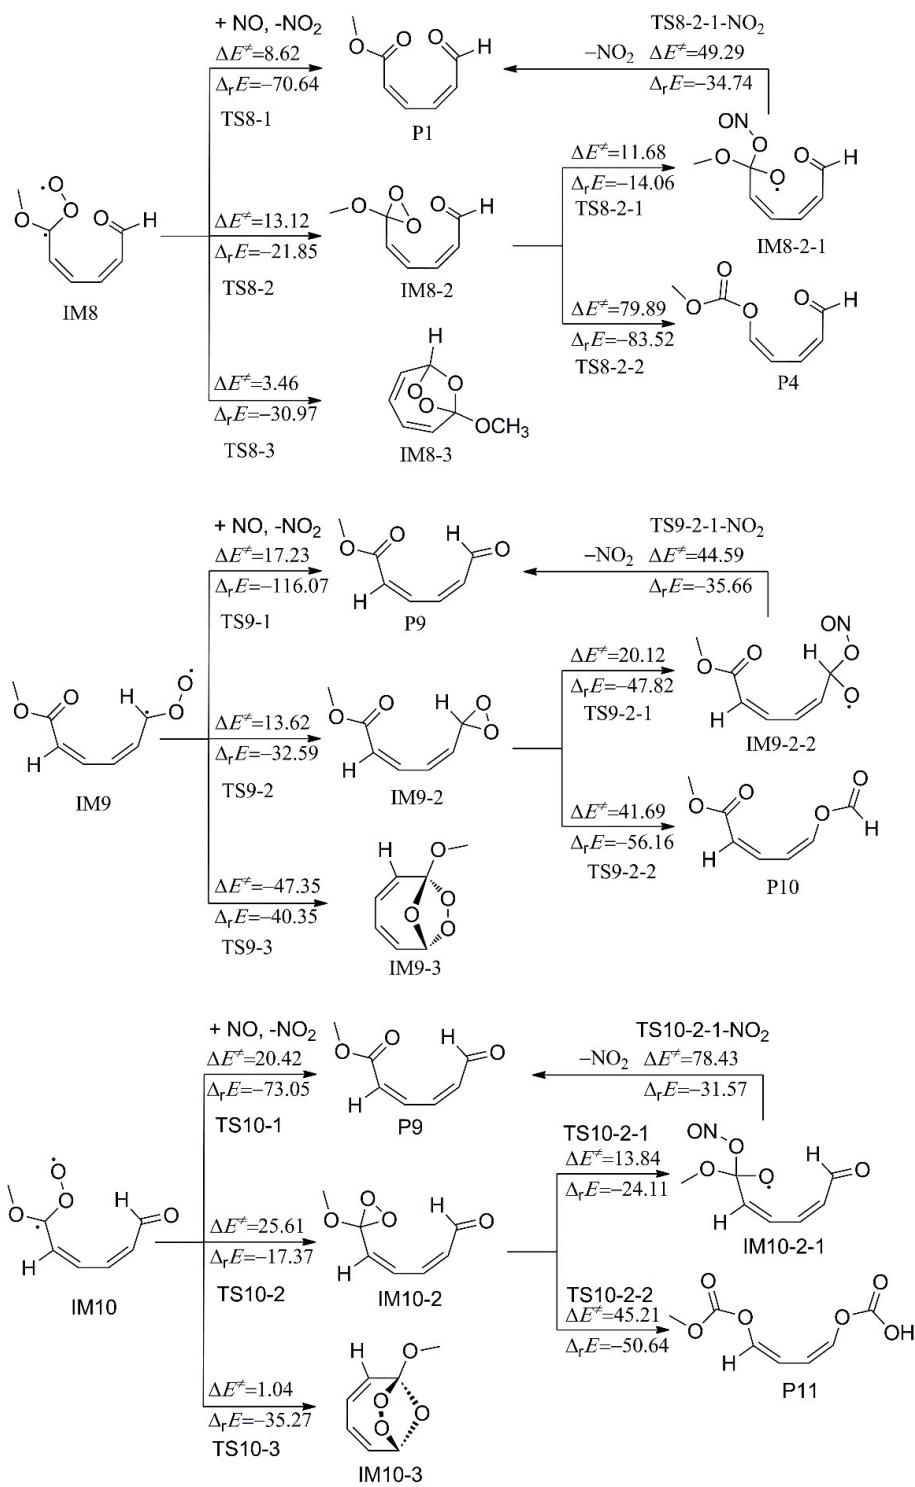

The rate constants of unimolecular reactions in this paper are obtained by solving the energy-grained master-equation with the MultiWell program.

The energy-dependent specific unimolecular rate constant is given as follows:

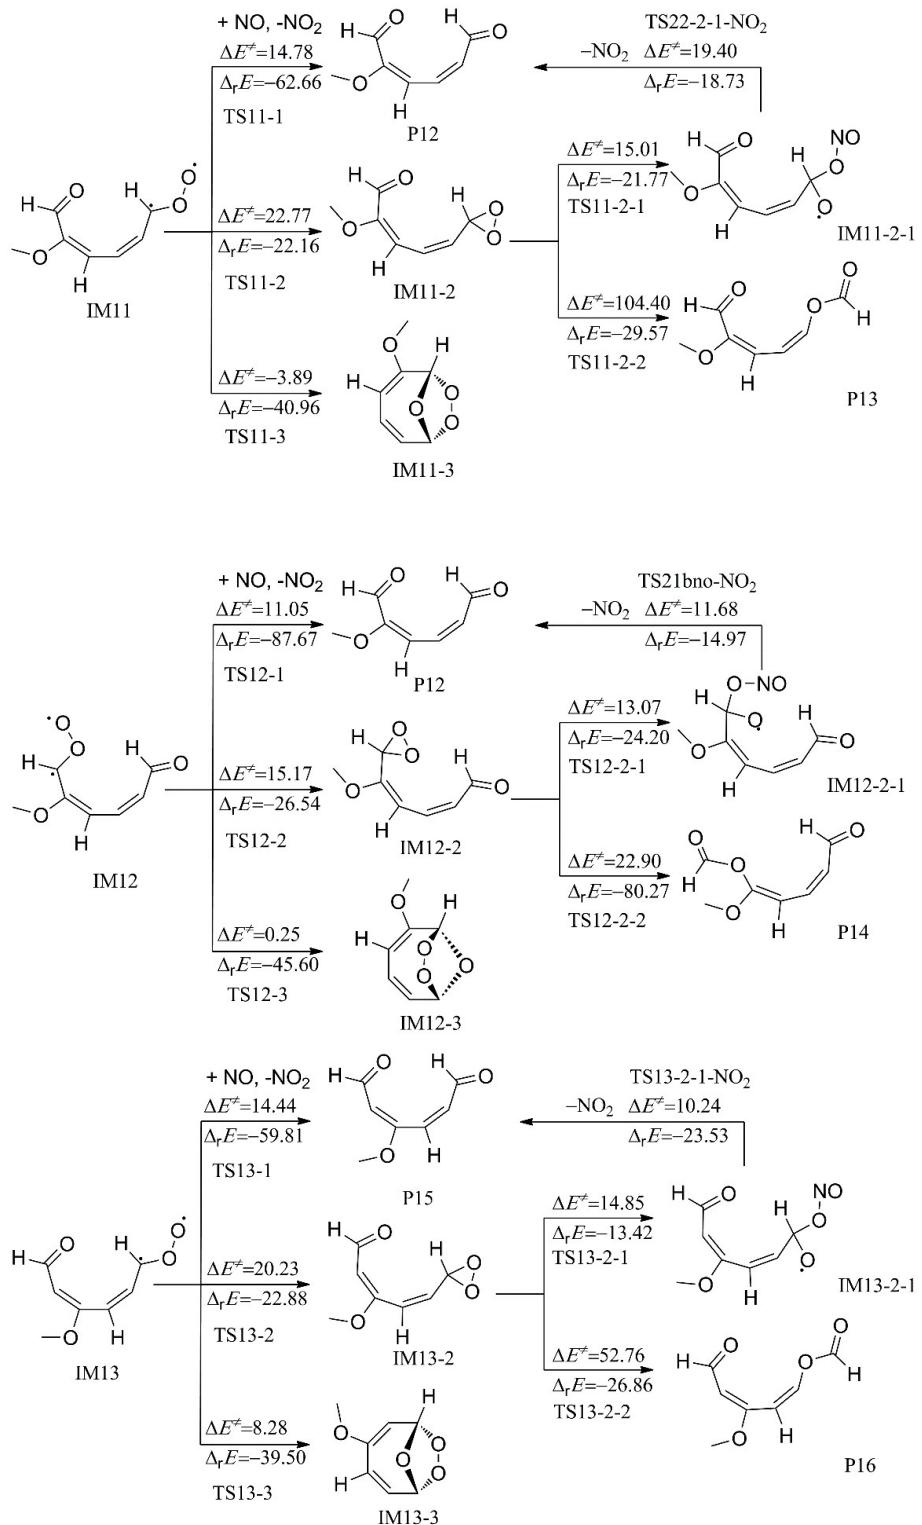

$$k(E) = \left[ \frac{m^{\neq} \sigma_{ext}}{m \sigma_{ext}^{\neq}} \right] \frac{g^{\neq} G^{\neq}(E - E_0)}{g h \rho(E)}$$

where  $m^{\neq}$  and  $m$  are the number of optical isomers,  $\sigma_{ext}^{\neq}$  and  $\sigma_{ext}$  are the external rotation symmetry numbers,  $g^{\neq}$  and  $g$  represent the electronic state degeneracies of the transition state and corresponding reactant, respectively.  $h$  is the Plank's constant.  $\rho(E)$  is the density of states of the reactant and  $G^{\neq}(E - E_0)$  is the sum of states of the transition state. In this work, the transition states of the entrance channels are treated as tight transition states rather than variational transition states.

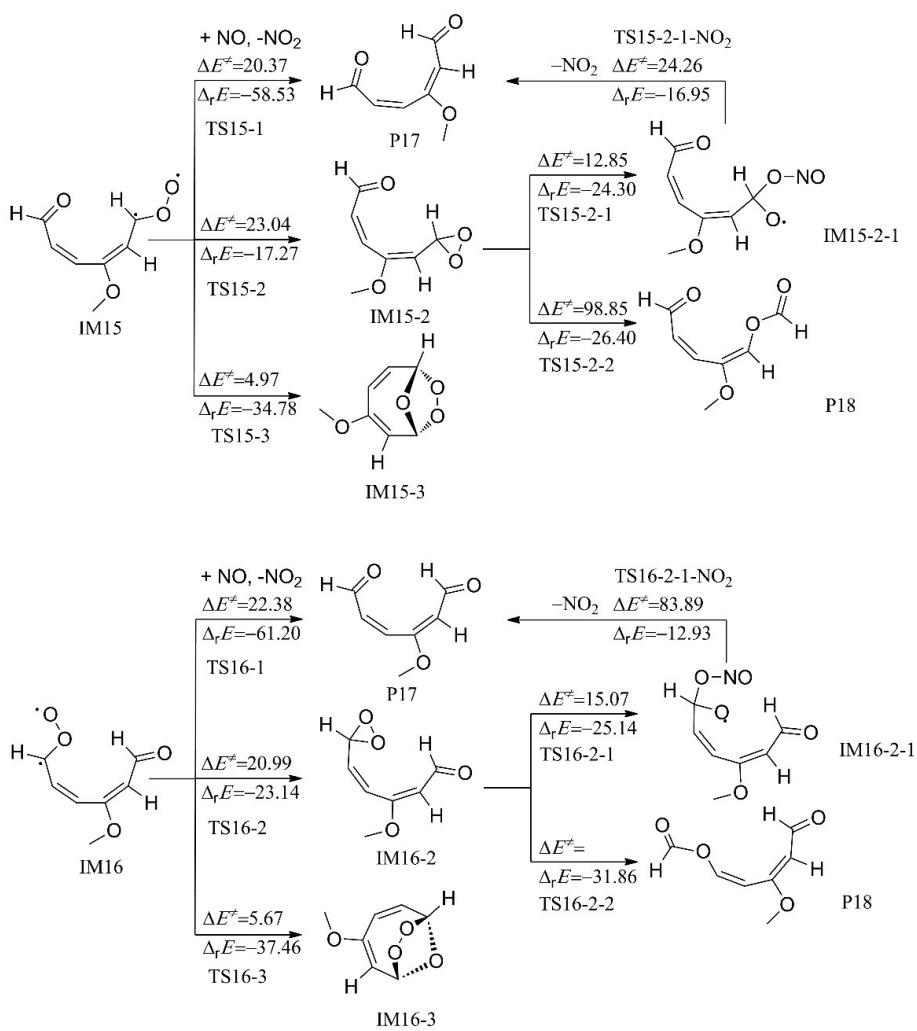

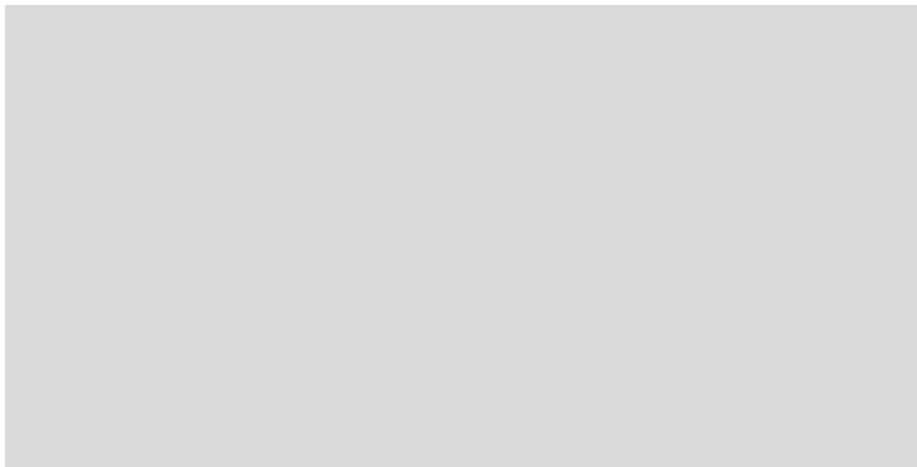

The collision rate constants were calculated by Klaus Luther's empirical function with kinetically controlled selective ionization parameters[2]. As the Lennard-Jones parameters for IM1 are not available from the literature, we try to estimate these parameters theoretically. The intermolecular interaction energy between the primary ozonide and argon bath gas has been estimated at the M06-2X/6-31+g(d,p) level as shown in Fig. S3 in Supplementary Information. So the Lennard-Jones parameter of IM1 was set as  $\sigma_{IM1} = 5.14 \text{ \AA}$  and  $\epsilon_{IM1}/k_b = 5840.80 \text{ K}$  to confirm that the Lennard-Jones parameters for IM1 + Ar collisions are in confidence with Fig. S3. The Lennard-Jones parameters for other intermediates are also set as  $\sigma = 5.14 \text{ \AA}$  and  $\epsilon/k_b = 5840.80 \text{ K}$  in the input files, for convenience.

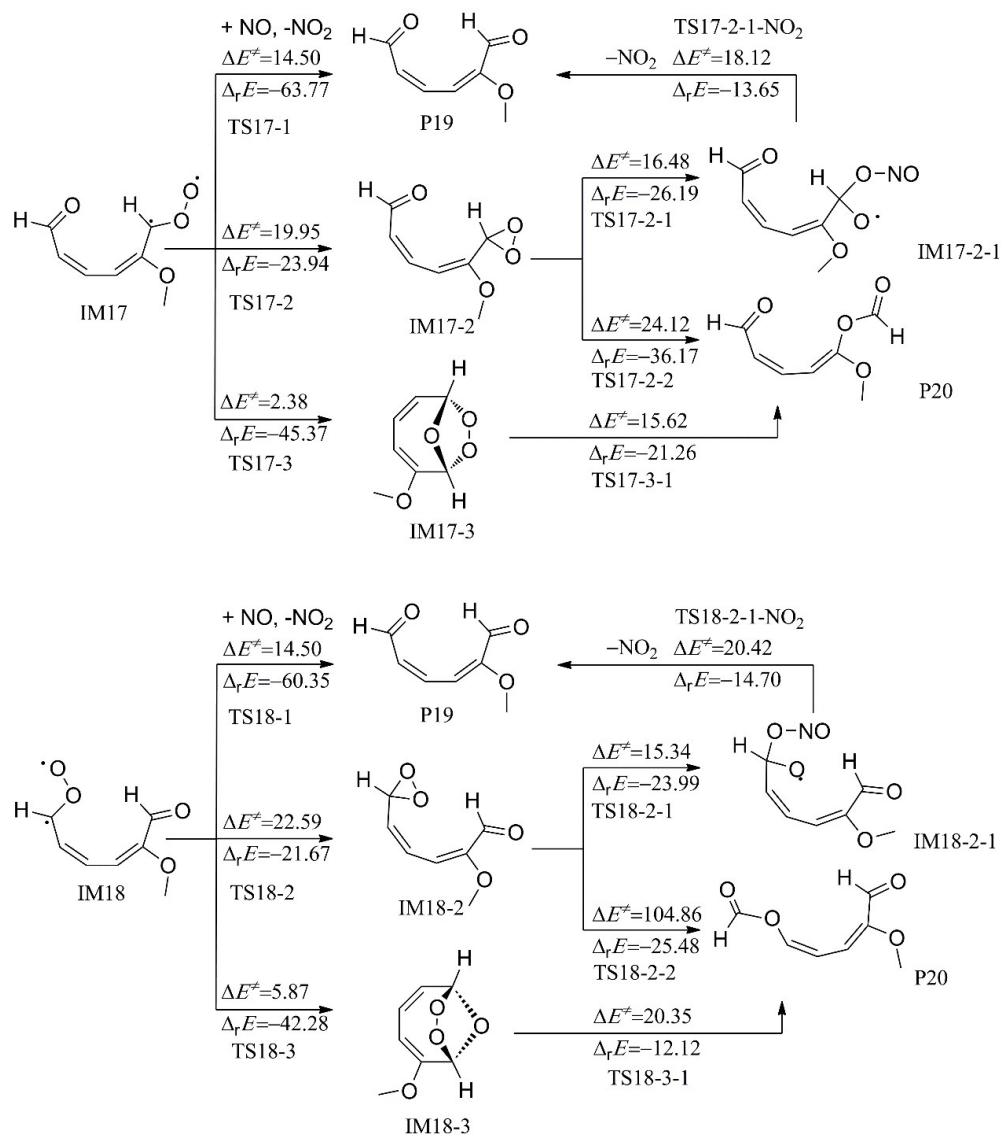

**Fig. S1.** The detailed mechanisms of the further reaction for the Criegee intermediates IM7, IM8, IM9, IM10, IM11, IM12, IM13, IM14, IM15, IM16, IM17 and IM18 respectively.
