Isolation procedure

General. Column chromatography (CC): silica gel H (10-40 μm) and silica gel (200-300 mesh) (Marine Chemical Factory, Qingdao, P. R. China); Sephadex LH-20 (Pharmacia Fine Chemicals, Piscataway, NJ, USA); RP-C18 gel (40-63 μm ; Daiso, Co., Japan). TLC: silica gel plates (Yantai Jiang You silicone development co., Yantai, P. R. China), visualization by spraying with 10 % H_2SO_4 in EtOH. Semi-preparative HPLC: Agilent 1260 series with a Zorbax SB-C18 (5 μm , 9.4 mm \times 25 cm) column. Melting point: X-4B digital display micro-melting apparatus (Shanghai jingsong instrument product, Shanghai, P. R. China). Optical rotation: Autopol VI (Rudolph Research Analytical, Hackettstown, NJ). CD spectra: Brighttime Chirascan (Applied Photophysics Ltd, UK). UV spectra: Agilent 1260 series DAD detector (Agilent Technologies, US). IR: Thermo Scientific Nicolet 6700 (Thermo Scientific, US). NMR Spectra: Bruker Avance III-500 and Avance III-600 spectrometers (Bruker, Switzerland). MS: Agilent MSD-Trap-XCT (for ESI) and Q-ToF micro mass spectrometer (for HR-ESI).

Plant Material. The aerial parts of *Inula linearifolia* was collected from Liaoning province of China in March 2016, and were authenticated by Professor Bao-Kang Huang, Department of Pharmacognosy, School of Pharmacy, Second Military Medical University. A voucher specimen (No. 201603-IL) is deposited in the Department of Pharmacognosy, Second Military Medical University

Isolation. The air-dried aerial parts of *I. linearifolia* (500 Kg) was extracted three times with 80% ethanol at room temperature to afford a crude extract (12.72 kg), which further partitioned by petroleum ether and CH_2Cl_2 , giving a CH_2Cl_2 -soluble fraction (6.86 kg). The CH_2Cl_2 fraction was segmented by silica gel (petroleum ether/EtOAc 5:1 and 1:1, respectively) to give two fractions. The second fraction (P/E 1:1, 1.70 Kg) was dissolved in 5L EtOAc, and filtered to eliminate the large amount of crystal (Britanin, 1.12 Kg, a major monomer in title plant). The concentrated filtrate (510 g) was chromatographed over MCI gel (MeOH/ H_2O , from 40 to 90%) to give Fr.1-Fr.6. Subsequently, Fr.4-Fr.6 were purified by semi-preparative and preparative HPLC ($\text{CH}_3\text{CN}/\text{H}_2\text{O}$ from 40 to 60%), yielding **1** (157 mg), **2** (12.75 g), **3** (86 mg) and **4** (114 mg).

Figure S50. NOESY spectrum of Linearifolianoid L (**4**) in CDCl₃

Measurement of LPS-Induced NO Production

RAW 264.7 cells were seeded in 96-well culture plates at 5×10^5 cells/well at 37 °C for 12 h in DMEM medium. The cells were pretreated with different concentrations of samples for 12 h and then incubated for 24 h with or without 1 $\mu\text{g}/\text{mL}$ LPS. The nitrite concentration in the culture supernatant was measured using Griess reagent (1% sulfanilamide, 0.1% N-1-naphthylenediamine dihydrochloride and 2.5% phosphoric acid). The absorbance was measured at 540 nm after incubation for 15 min. The nitrite levels in the samples were calculated from a standard curve created using known concentrations of sodium nitrite. Cell viability was measured by a MTT [3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide] assay (Beyotime, China).

RAW 264.7 cells were purchased from ATCC. Dulbecco's modified Eagle's medium (DMEM) and fetal bovine serum were purchased from Gibco Invitrogen (Carlsbad, CA, USA). LPS, Griess reagent was purchased from Sigma-Aldrich (St. Louis, MO, USA).

Table S3. IC₅₀ values (μM) of **1-4** from *Inula lineariifolia* against LPS-induced nitric oxide (NO) production

NO	1	2	3	Mean \pm SD IC ₅₀ (μM)
Compound 1	1.098	1.023	0.9517	1.024 \pm 0.059
Compound 2	2.366	1.517	1.484	1.789 \pm 0.48
Compound 3	9.738	10.41	10.01	10.02 \pm 0.27
Compound 4	10.54	10.09	9.869	10.16 \pm 0.27
Aminoguanidine	2.98	3.14	3.09	3.06 \pm 0.081

- Aminoguanidine was positive control.
- Compounds **1-4** were not exhibited significantly cytotoxic at the concentrations required for inhibition NO production (as determined by MTT assay).
