**Figure S1.** Polymer preforms grooved in lathe prior to fiber drawing. (a) PEI grooved preform, (b) PC grooved preform, and (c) edge view of PC grooved preform showing grooves and hollow core after removing Teflon rod.

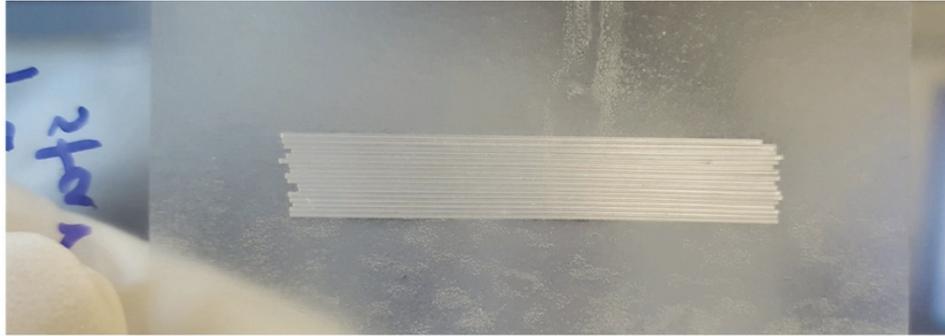

**Figure S2.** SEM image of (a) cross-section of smooth PEI fiber with a diameter of 300  $\mu\text{m}$ , (b) 200  $\mu\text{m}$ , 300  $\mu\text{m}$ , and 500  $\mu\text{m}$  of smooth PEI fibers, (c) cross-section of PC star-shaped fiber of 300  $\mu\text{m}$  diameter, and (d) TEM micrograph of interconnected ormosil colloidal nanoparticles (with sizes of about 10 nm) forming a porous network layer.

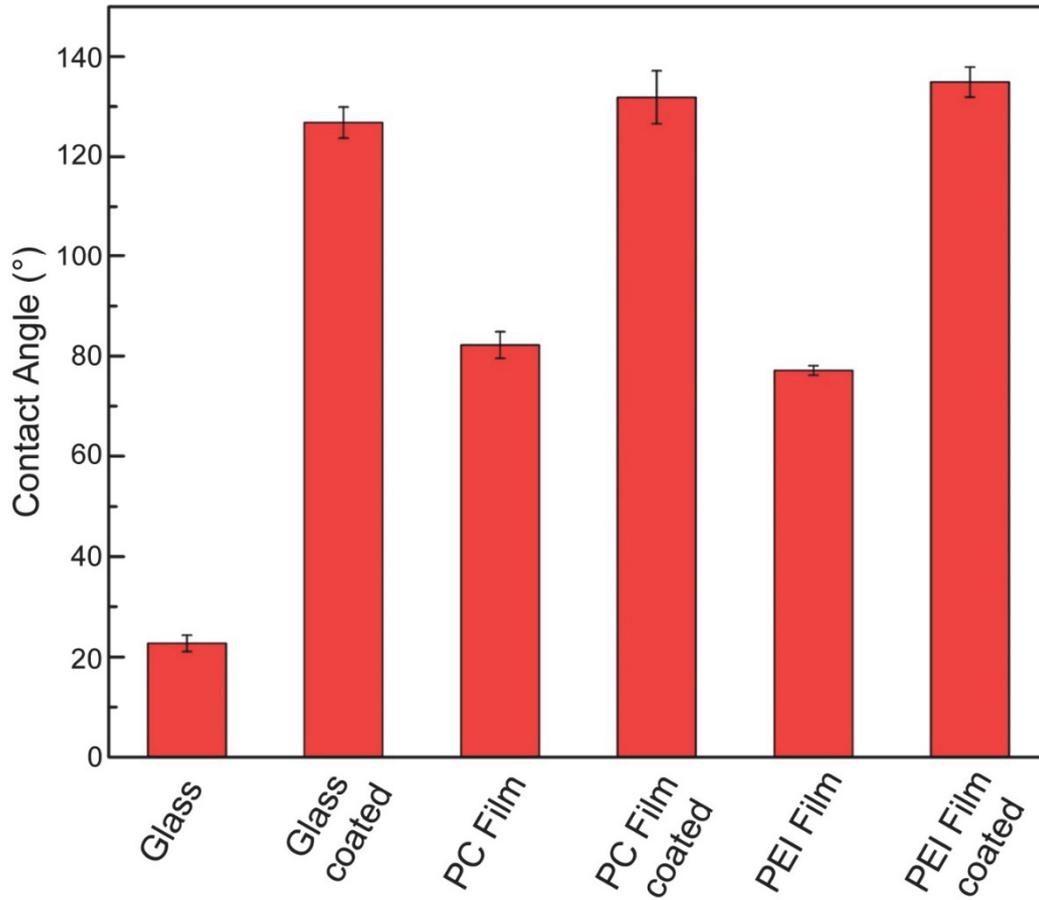

**Figure S3.** Schematic illustration of ORMOSIL nanoparticle spray coating on fiber surface. Spray gun is loaded with diluted ORMOSIL solution, and then a surface is brought into close proximity (approximately 30 cm away from the gun) with the gun. ORMOSIL gel was diluted in methanol solution. Pressurized nitrogen gas passes through the gun at 2 bar and the solution is sprayed onto fibers for about 2 – 3 seconds at ambient atmosphere. The sample is let dried at room temperature.
