Full Calculation Details

All the work was done using density functional theory with the Gaussian09 software suite. The neutral and charged geometry optimizations were completed using the CAM-B3LYP functional with the 6-31g** basis set. The conductor-like polarizable continuum model and chlorobenzene solvent as implemented in the Gaussian 09 software package were used for solvent-based calculations. Excess charges were calculated using the natural population analysis in the NBO suite of calculations included in Gaussian09. The atom charges in the neutral species were subtracted from the charged and the differences was added up according to what atoms along the backbone were included in each unit, either CDT or PT/BT. The internal reorganization energies were completed using the following equation:

$$\lambda = \lambda_1 + \lambda_2 = (E_+^* - E_+) + (E^* - E)$$

where the lambda 1 is the difference in the charged species and lambda 2 is the difference in the neutral species.

First principle tight binding modeling of planar polymers

Methodology for images below: Occupied valence molecular orbitals of π -symmetry of oligomers consisting of 16 monomers where localized using combination of top-down and bottom-up approaches [1]. The Fock matrix is then projected onto these LMOs to get tight-binding Hamiltonian. The Hamiltonian of an infinite polymer is obtained by extrapolating the Hamiltonian of the oligomer, taking into account exponential decrease of its elements with spatial separation between LMOs, see Fig. S13.

[1] Z Li, H Li, B Suo, W Liu, Localization of Molecular Orbitals: From Fragments to Molecule, *Acc Chem Res* 47, 2758 (2014)

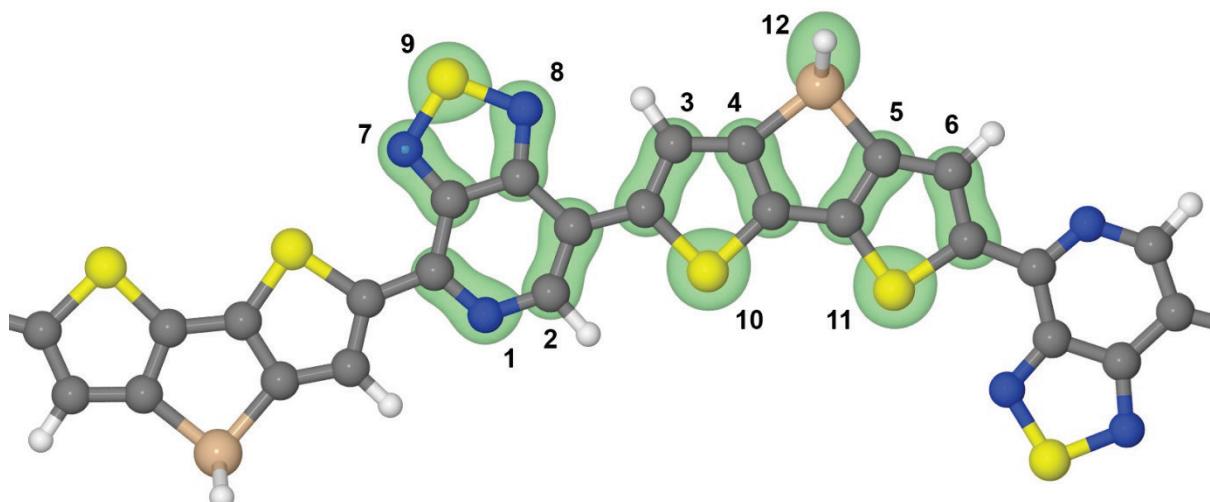

Figure S10. Localized molecular orbitals (LMO): there are 12 LMOs in the repeating unit. Shown here is the part of P1 (O2) polymer.

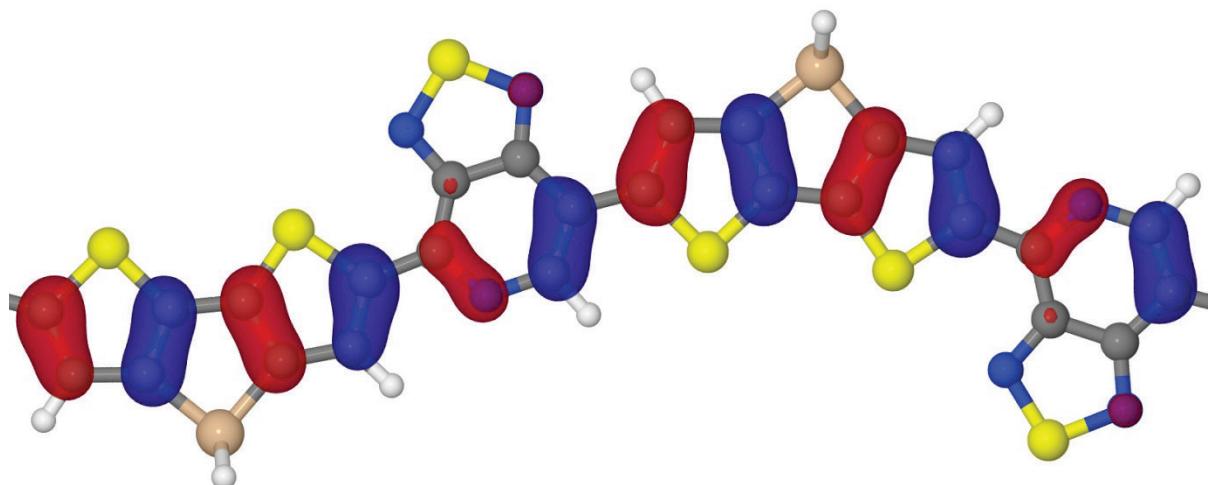

Figure S11. HOMO of the polymer P1 (central part of the long enough oligomer). It is composed primarily of LMOs 1-6 from Fig. S10.

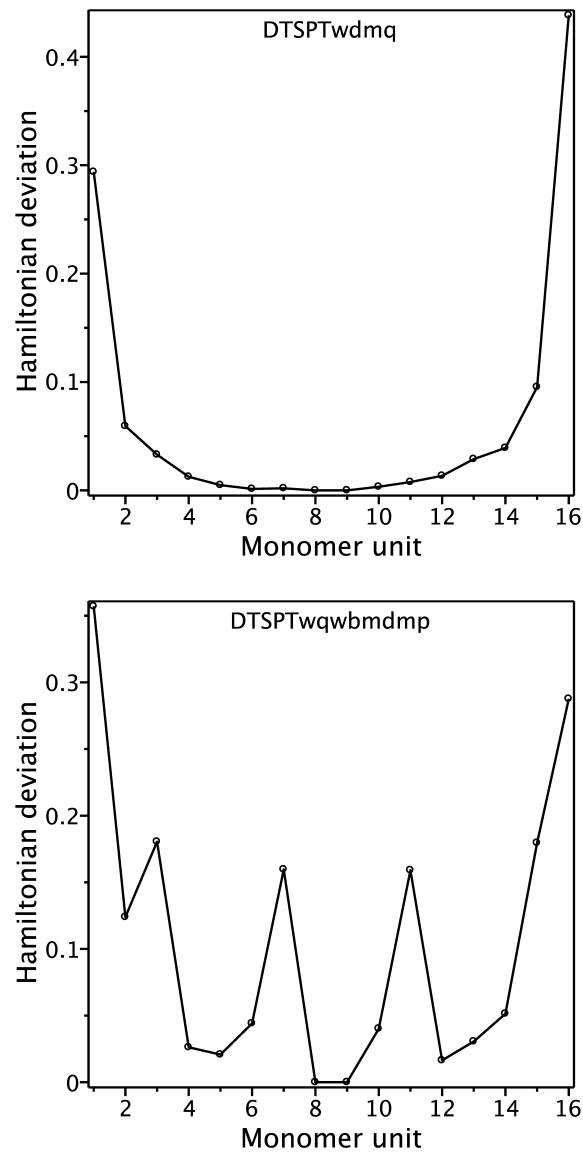

Figure S12. Intra-monomer tight-binding Hamiltonian deviations (Frobenius norm) across the oligomers P1 (left) and P2 (right). The same-order deviations are observed between different polymers (P1,P2,P3) – few tenths of eV, that is not enough to introduce a noticeable disorder in a tight-binding Hamiltonian with 1.2-1.4 eV inter-site couplings.

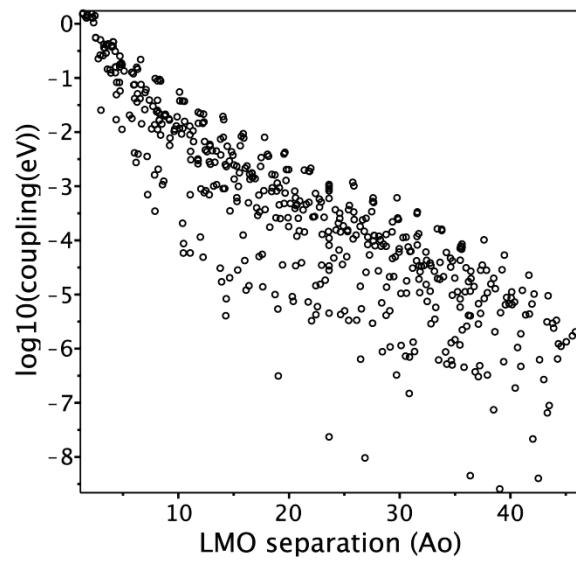

Figure S13. Exponential decrease of elements of tight-binding Hamiltonian with separation between LMOs.

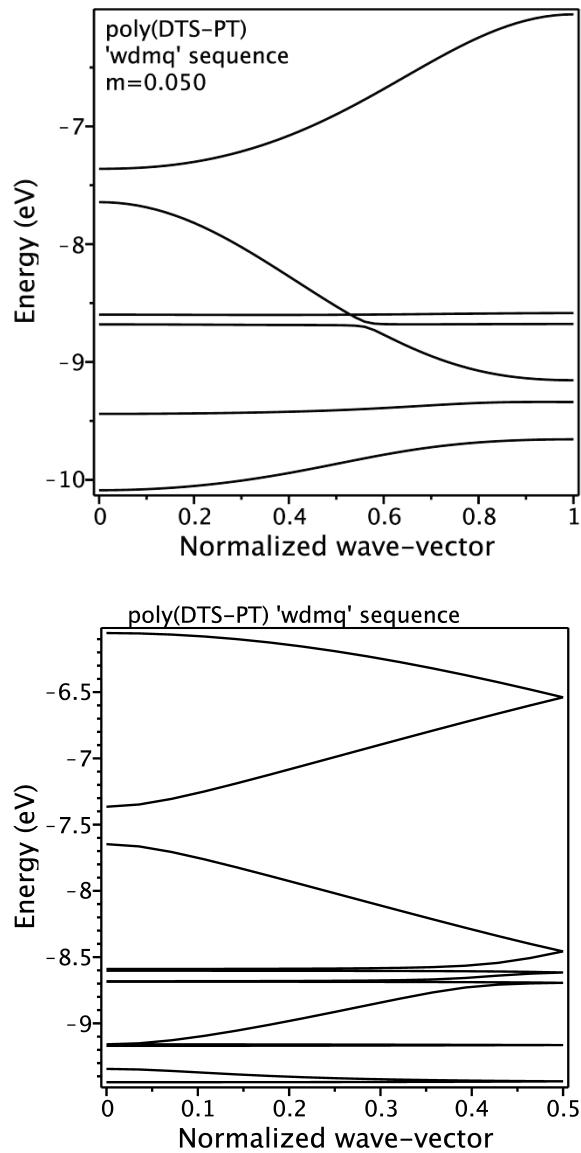

Figure S14. Electronic structure of the valence band of a planar P1 polymer: our simplified approach (π -bands only) vs. straightforward periodic boundary conditions calculations. Both approaches are numerically identical.

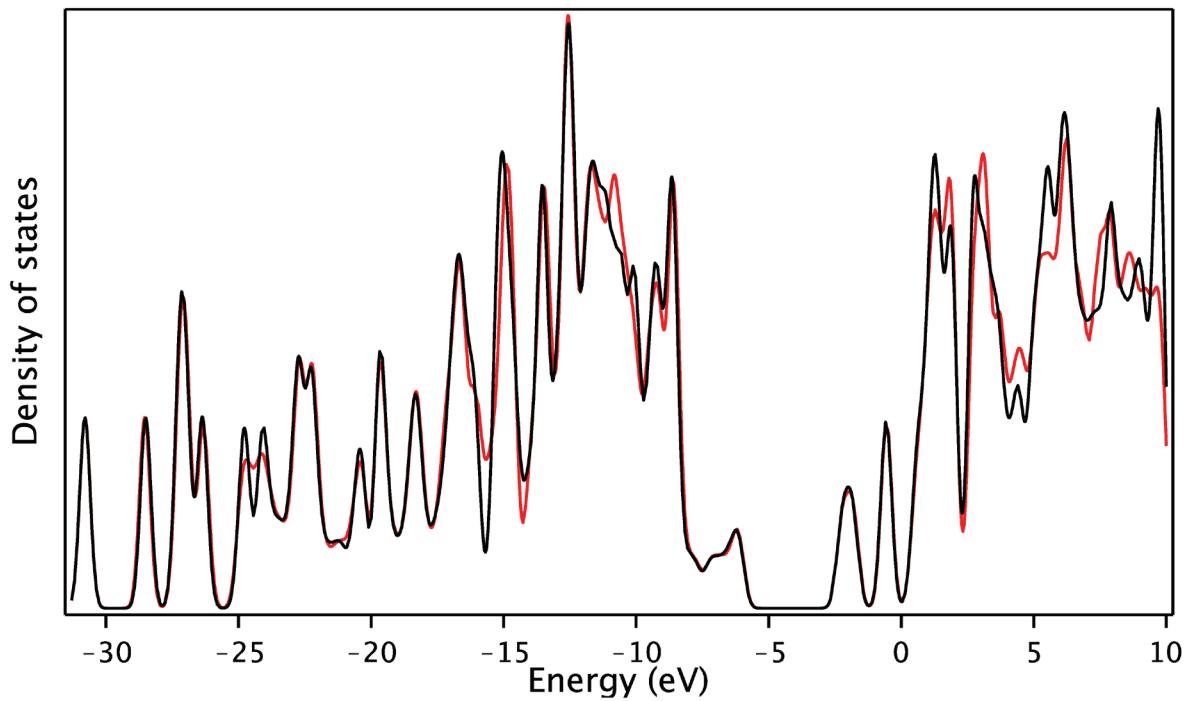

Figure S15. Comparison of electronic density of states: P1 (black) vs. P2 (red).

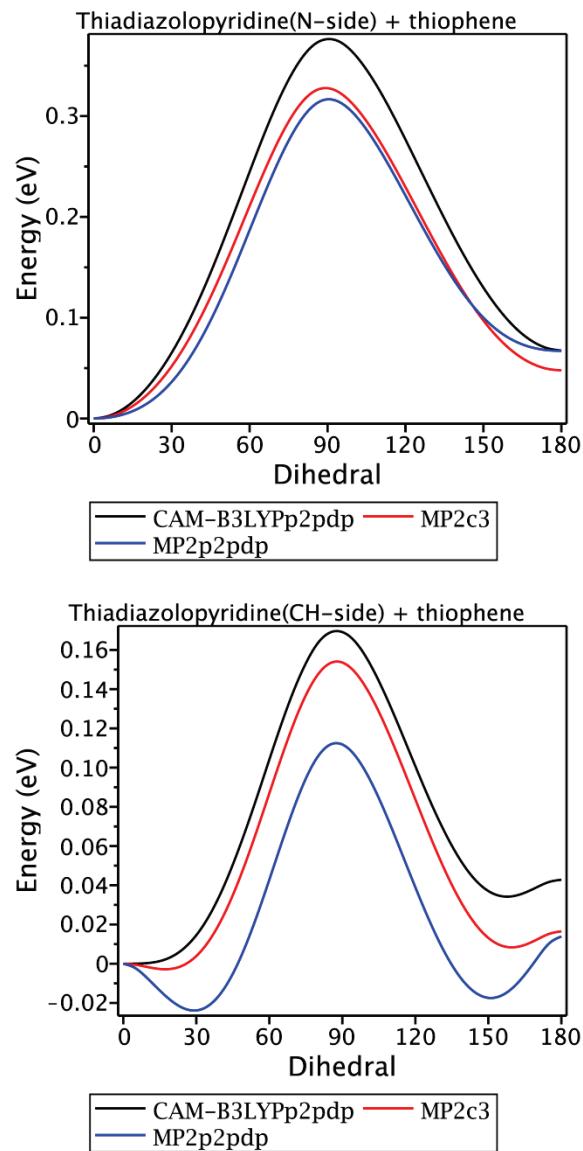

Figure S16. Potential energy surface for the two principal dihedrals determining geometry of the studied polymers. Zero dihedral corresponds to the trans orientation of sulfur atoms.

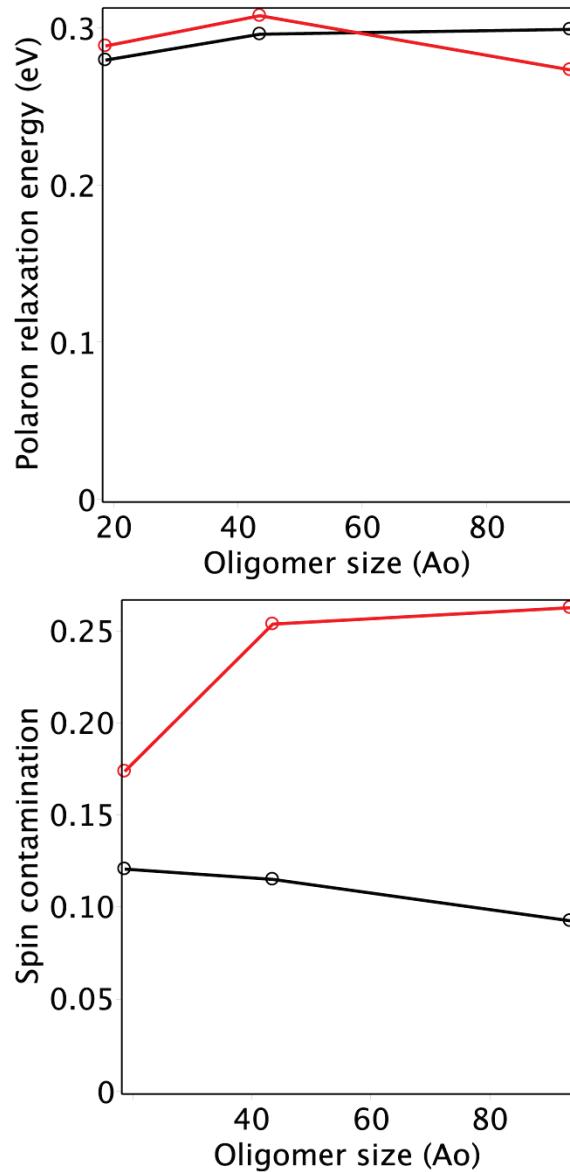

Figure S17. Convergence of polaron relaxation energy (λ_1 and λ_2) and spin contamination with oligomer size.
