## 1. General Methods

All chemicals were obtained from commercial suppliers and were used as received unless other-wise noted. All reactions were conducted with oven-dried glassware under atmosphere or nitrogen. Solvents were dried and distilled following usual protocols. Column chromatography was carried out using silica gel (300-400 mesh). Solvents for extraction and chromatography were reagent grade. $\mathrm{CDCl}_{3}$ and $\mathrm{CD}_{3} \mathrm{COCD}_{3}$ were from Cambridge Isotope Laboratories (CIL).

Analytical NMR spectra were recorded on Bruker AVANCE AV II-400 MHz or Bruker AVANCE AV II-600 MHz, at a constant temperature of 298 K . Chemical shifts are reported in $\delta$ values in ppm using tetramethylsilane (TMS) or residual solvent as internal standard and coupling constants ( $J$ ) are denoted in Hz . Multiplicities are denoted as follows: $\mathrm{s}=$ singlet, $\mathrm{d}=$ doublet, $\mathrm{t}=$ triplet, $\mathrm{dd}=$ double doublet and $\mathrm{m}=$ multiplet. MALDI-TOF MS spectra were recorded on a Bruker Autoflex III MS spectrometer, matrix is 2,6-dihydroxyacetophenone (DHAP). ESI mass spectra were recorded on a Bruker Daltonics MicroTOF-Q II. ESI-MS were obtained on a Thermo-ITQ. UV-vis spectra were measured by SHIMADZU UV-2450. Fourier transform Infrared (FT-IR) data were collected by a Thermal Nicolet NEXUS 670 FT-IR spectrophotometer. Single crystal X-ray data were measured on a Xcalibur E diffractometer with graphite monochromated $\mathrm{Mo}-\mathrm{K}_{\alpha}$ radiation $(\lambda=0.7107 \AA$ ). Data collection and structure refinement details can be found in the CIF files or obtained free of charge via www.ccdc.cam.ac.uk/data_request/cif.

## Synthesis of cyclo[6]aramide 3.

1,5-Dimethoxy-2,4-dinitrobenzene ${ }^{[1]}(500 \mathrm{mg}, 2.19 \mathrm{mmol})$ was hydrogenated in the presence of $20 \% \mathrm{Pd} / \mathrm{C}(100 \mathrm{mg})$ at 0.3 MPa for 10 h at room temperature. The solution was filtered in darkness as fast as possible followed by immediate removal of the solvent. The reduced diamine was used for the immediate coupling reaction. 4,6-Bis(2-ethylbutoxy)isophthaloyl dichloride ( $761 \mathrm{mg}, 2.19 \mathrm{mmol}$ ) was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(80 \mathrm{~mL})$ and added dropwise to a mixture of the above diamine and $\mathrm{Et}_{3} \mathrm{~N}$ $(1.11 \mathrm{~g}, 10.95 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(200 \mathrm{~mL})$ at $0{ }^{\circ} \mathrm{C}$. The solution was stirred at $0{ }^{\circ} \mathrm{C}$ under $\mathrm{N}_{2}$ for 4 h . The organic layer was washed with water ( $20 \mathrm{~mL} \times 3$ ) and dried
over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and filtered. Addition of acetone/ $\mathrm{CH}_{3} \mathrm{OH}$ to the filtrate caused a precipitation, which was filtered to give a white solid $\mathbf{3}(677 \mathrm{mg}, 62 \%)$.

## Synthesis of heteroditopic cyclo[6]aramides 5 .

Compounds 5a, 5b and $\mathbf{5}$ were synthesized according to analogous literature procedures. ${ }^{[4]} \mathbf{5 a}$ and $\mathbf{5 b}$ were converted into $\mathbf{5 a}$, and $\mathbf{5 b}$ ' by catalytic hydrogenation, respectively. Compounds $\mathbf{5 a}$ ' and $\mathbf{5 b}$ ' were used directly in the subsequent reaction without further purification.

The solution was filtered in darkness as fast as possible followed by immediate removal of the solvent. The reduced diamine was used for the immediate coupling reaction. DMF ( 5 uL ) was added to a suspension of compound $\mathbf{5 b}(94 \mathrm{mg}, 0.28 \mathrm{mmol})$ and oxalyl chloride ( 105 $\mathrm{mg}, 0.84 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The mixture was stirred for 40 min at room temperature. The solvent was evaporated and the resulting acid chloride was dried in vacuum at room temperature for 30 min to get compound $\mathbf{5 b}$ '. Compound $\mathbf{5 b}$ ' was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(60 \mathrm{~mL})$ and added dropwise to a mixture of the above 5a' and $\mathrm{Et}_{3} \mathrm{~N}(162 \mathrm{mg}$, $1.60 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(20 \mathrm{~mL})$ at $0{ }^{\circ} \mathrm{C}$. The solution was stirred under $\mathrm{N}_{2}$ for 7 h . The organic layer was washed with water $(20 \mathrm{~mL} \times 3)$ and dried over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and filtered. The crude product was purified by chromatography on silica gel $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH}=20: 1\right)$ to provide the product 5 as a light yellow solid $(291 \mathrm{mg}$, $62 \%)$.

The solid was dissolved in $\mathrm{CH}_{3} \mathrm{CN}-\mathrm{H}_{2} \mathrm{O}$ and saturated aqueous $\mathrm{NH}_{4} \mathrm{PF}_{6}$ was added. The organic solvent was then evaporated under reduced pressure. The precipitate was collected and washed with $\mathrm{H}_{2} \mathrm{O}$. Then the crude material was purified twice by column chromatography using silica gel (eluent: $\mathrm{CH}_{3} \mathrm{COCH}_{3}$ and then $\mathrm{CH}_{3} \mathrm{COCH}_{3}$ with $2 \% \mathrm{NH}_{4} \mathrm{PF}_{6}(\mathrm{~m} / \mathrm{v})$ ) and the main fraction was collected. Then, $\mathrm{H}_{2} \mathrm{O}$ ( 200 mL ) was added to the residue in order to remove excess $\mathrm{NH}_{4} \mathrm{PF}_{6}$, leaving the product as an orange precipitate. The solid was collected by filtration, further washed with excess $\mathrm{H}_{2} \mathrm{O}$ and dried under high vacuum to afford the Axle-1 as a dark red solid ( $69 \mathrm{mg}, 92 \%$ ).

## "Click-capping" approach for the synthesis of [3]rotaxanes or [2]rotaxanes ${ }^{[8]}$

General procedure for [3]CR-C $\mathbf{C}_{\mathbf{n}}(\mathbf{n}=\mathbf{1 6}, \mathbf{1 2}, \mathbf{6})$
Condition A (Entries 1-3, Table 1 in the main text)
A mixture of macrocycle 1-3 (2.0 equiv.), guest $\mathbf{G 4}$ ( 1.0 equiv.) and $\mathrm{Cu}\left(\mathrm{CH}_{3} \mathrm{CN}\right)_{4} \mathrm{PF}_{6}$ ( 0.3 equiv.) was stirred in dry acetone at room temperature for 20 minutes under $\mathrm{N}_{2}$. Then a solution of Stopper- $\mathbf{N}_{3}$ ( 2.5 equiv.) and $\mathrm{N}, \mathrm{N}$-diisopropylethylamine (DIPEA) ( 1.2 equiv.) was injected. The mixture was further stirred at $40{ }^{\circ} \mathrm{C}$ for 24 h . The resulting solution was washed with $16 \%$ aqueous EDTA tetra-sodium saturated ammonia solution $(2 \times 50 \mathrm{~mL})$. The organic layer was retained and the aqueous layer
extracted twice with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2 \times 50 \mathrm{~mL})$. The organic extracts were combined and washed by water, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and dried in vacuo. ### 4.2 2D NMR Spectra of Host-Guest Complexes

### 4.2.1 2D-NOESY Spectra of Host-Guest Complexes

NOESY NMR spectroscopic studies were carried out in an effort to elucidate the nature of the host-guest interactions between cyclo[6]aramide $\mathbf{1}$ and pyridinium guests G1-G4 in $\mathrm{CD}_{3} \mathrm{COCD}_{3}$ solution. In the resulting spectra of $\mathbf{1}_{2} \supset \mathbf{G 1}$, correlations between $\left(\mathrm{H}^{\mathrm{a}}, \mathrm{H}^{\mathrm{b}}\right)$ and $\mathrm{H}^{2},\left(\mathrm{H}^{\mathrm{a}}, \mathrm{H}^{\mathrm{b}}\right)$ and $\mathrm{H}^{3}$ were observed. In the resulting spectra of $\mathbf{1}$ $\supset \mathbf{G 4}$, correlations between $\mathrm{H}^{\mathrm{a}}$ and $\left(\mathrm{H}^{13}, \mathrm{H}^{14}, \mathrm{H}^{15}\right), \mathrm{H}^{\mathrm{b}}$ and $\left(\mathrm{H}^{13}, \mathrm{H}^{14}, \mathrm{H}^{15}\right)$, were observed. These spectra are consistent with the guests complexed in the cavities of cyclo[6]aramides and the threaded binding mode shown in Scheme 1 of the main text. Also, in the resulting spectra of $\mathbf{1}_{2} \supset \mathbf{G 2}$, correlations between $\mathrm{H}^{\mathrm{a}}$ and $\left(\mathrm{H}^{5}, \mathrm{H}^{6}, \mathrm{H}^{7}, \mathrm{H}^{8}\right)$, $H^{b}$ and $\left(\mathrm{H}^{6}, \mathrm{H}^{8}\right)$ were observed. In the resulting spectra of $\mathbf{1} \supset \mathbf{G 3}$, correlations between $\mathrm{H}^{\mathrm{a}}$ and $\left(\mathrm{H}^{9}, \mathrm{H}^{10}, \mathrm{H}^{12}\right), \mathrm{H}^{\mathrm{b}}$ and $\mathrm{H}^{12}$ were observed.

### 4.2.2 2D-DOSY Spectra of Host-Guest Complexes

2D-DOSY spectroscopic analyses provided evidence that a stable complex was formed between host cyclo[6]aramide 1 and pyridinium guests G1-G4. For the complexes $\mathbf{1}_{2} \supset \mathbf{G 1}, \mathbf{1}_{2} \supset \mathbf{G} \mathbf{2}$ and $\mathbf{1}_{2} \supset \mathbf{G 4}$, all of the protons except the solvent, including those located on 1 and guests (G1, G2 and G4), showed the same diffusion constants in the representative solution state mixtures. For the complex of $\mathbf{1} \supset \mathbf{G 3}$, all of the protons, including those located on $\mathbf{1}$ and G3 showed the very similar diffusion constants in the representative solution state mixtures.

### 4.5 Determination of the Stoichiometries and Binding Constants

To determine the binding constants ( $K_{a}$ ) for cyclo[6]aramide $\mathbf{1}$ binding with guests G1-G4, UV-vis titration experiments were done with $\mathrm{CH}_{3} \mathrm{COCH}_{3}$ solutions which had a constant concentration of cyclo[6]aramide $\mathbf{1}$ and varying concentration of guests G1-G4. For each titration, at least 30 data points were collected. Typically wavelength was monitored around the absorption maxima for the complex formed. This gave data sets from which the binding constants were obtained using a custom written global nonlinear regression analysis program within the Matlab 8.1 by Thordarson ${ }^{[1]}$.

From the job plot and molar ratio plot, 2:1 stoichiometries were obtained for $\mathbf{1}_{2} \supset \mathbf{G 1}$, $\mathbf{1}_{2} \supset \mathbf{G} \mathbf{2}$ and $\mathbf{1}_{2} \supset \mathbf{G 4}$. The binding constants ( $K_{1}$ and $K_{2}$ ) were estimated by a non-linear curve-fitting method with the equation $\mathbf{S}-1:{ }^{[1]}$

$$
\begin{aligned}
& \Delta A=\frac{[G]_{0}\left(\varepsilon_{\Delta H G} K_{1}[H]+2 \varepsilon_{\Delta H_{2} G} K_{1} K_{2}[H]^{2}\right)}{1+K_{1}[H]+K_{1} K_{2}[H]^{2}} \\
& \mathbf{H}+\mathbf{G} \stackrel{\mathrm{K}_{1}}{\longrightarrow} \mathbf{H G} \quad \mathbf{H G}+\mathbf{H} \stackrel{\mathrm{K}_{2}}{\longrightarrow} \mathbf{H}_{\mathbf{2}} \mathbf{G}
\end{aligned}
$$

$$
\begin{gathered}
K_{1}=\frac{[H G]}{[H][G]} \quad K_{2}=\frac{\left[H_{2} G\right]}{[H G][H]}=\frac{\left[H_{2} G\right]}{K_{1}[H]^{2}[G]} \\
{[H]_{0}=[H]+[H G]+2\left[H_{2} G\right] \quad[G]_{0}=[G]+[H G]+\left[H_{2} G\right]}
\end{gathered}
$$

$K_{1} K_{2}[H]^{3}+\left(K_{1}+2 K_{1} K_{2}[G]_{0}-K_{1} K_{2}[H]_{0}\right)[H]^{2}+\left(K_{1}[G]_{0}-K_{1}[H]_{0}+1\right)[H]-[H]_{0}=0$
(S-2)
This cubic equation S-2 is solved directly in Matlab3 and the results put into equation S-1.

Where $[\mathrm{G}]_{0}$ is the concentration of guests ( $\mathbf{G 1}, \mathbf{G 2}$ and $\mathbf{G 4}$ ), $[\mathrm{H}]_{0}$ is the concentration of cyclo[6]aramide $1, \Delta \mathrm{~A}$ is the absorption change of the complex formed, $\varepsilon_{\Delta \mathrm{HG}}$ is the molar extinction coefficient of 1 to 1 host-guest complex, $\varepsilon_{\Delta \mathrm{H}_{2} \mathrm{G}}$ is the molar extinction coefficient of 2 to 1 host-guest complex.

The binding constant ( $K_{a}$ ) was estimated by a non-linear curve-fitting method with the equation $\mathbf{S - 3}$ by UV-vis titration experiments: ${ }^{[1]}$

$$

The binding constant of complex $\mathbf{1} \supset \mathbf{G 3}$ in $\mathrm{CD}_{3} \mathrm{COCD}_{3}$ was determined by NMR titration experiments with keeping the concentration of $\mathbf{G 3}$ as a constant $(1.0 \mathrm{mM})$ and varying the concentration of $\mathbf{1}(0-2.0 \mathrm{mM})$. The binding constant was determined by plotting the chemical shift of proton $\mathrm{H}^{10}$ on $\mathbf{G} \mathbf{3}$ versus the concentration of $\mathbf{1}$ based on
the following equation ${ }^{[2]}$ :

$$
\delta_{o b s}=\delta_{f}+\frac{\delta_{b}-\delta_{f}}{2[H]_{0}}\left\{\frac{1}{K_{a}}+[G]_{0}+[H]_{0}-\sqrt{\left(\frac{1}{K_{a}}+[G]_{0}+[H]_{0}\right)^{2}-4[H]_{0}[G]_{0}}\right\}
$$

where $\delta_{o b s}$ is the observed chemical shift of proton $\mathrm{H}^{10} ; \delta_{b}$ is the chemical shift of proton $\mathrm{H}^{10}$ in complex; $\delta_{f}$ is the chemical shift of proton $\mathrm{H}^{10}$ in free $\mathbf{G 3}$; $[H]_{0}$ is the total concentration of $\mathbf{1} ;[G]_{0}$ is the total concentration of $\mathbf{G 3} ; K_{a}$ is the binding constant.
The binding constants for $\mathbf{5}_{2} \supset \mathbf{G 4}\left(K_{1}\right.$ and $K_{2}$ ) were estimated by a non-linear curve-fitting method with the equation $\mathbf{S}-\mathbf{5}$ and $\mathbf{S}-6:{ }^{[1]}$

$$
\begin{equation*}
\Delta \delta=\left(\delta_{\Delta \mathrm{HG}} K_{l}[\mathrm{G}]_{0}[\mathrm{H}]+2 \delta_{\Delta \mathrm{H} 2 \mathrm{G}} K_{l} K_{2}[\mathrm{G}]_{0}[\mathrm{H}]^{2}\right) /\left([\mathrm{H}]_{0}\left(1+K_{l}[\mathrm{H}]+K_{l} K_{2}[\mathrm{H}]^{2}\right)\right) \tag{Eq.}

$$

We can quantify the extent of this cooperativity with the interaction parameter a according to Eq. S-5. ${ }^{[1]}$ If $\boldsymbol{\alpha}>1$ the system displays positive cooperativity, if $\boldsymbol{\alpha}<$ 1 it displays negative cooperativity and if $\boldsymbol{\alpha}=1$, the system displays non-cooperative binding.
