(Dated: January 29, 2016)

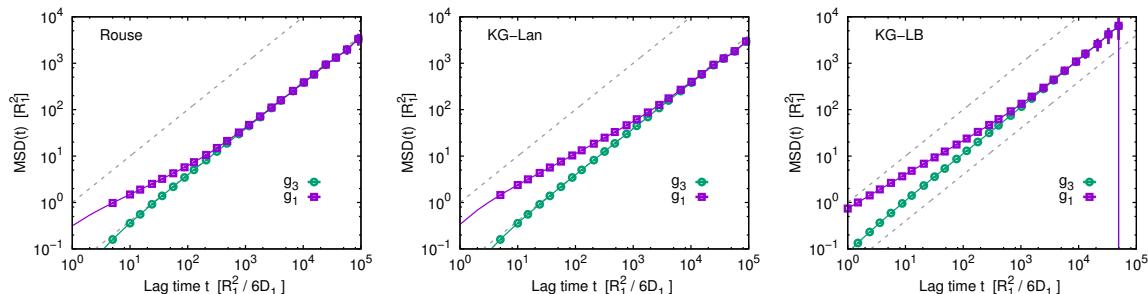

FIG. 1. $MSD(t)$ for the Rouse model (Rouse), Kremer-Grest model in the Langevin thermostat (KG-Lan) and Kremer-Grest model with Lattice-Boltzmann hydrodynamics (KG-LB). For comparison, we show the $MSD(t)$ of the centre of mass of the chain ($g_3(t)$) and of a single monomer ($g_1(t)$) averaged over all monomers of the chain.

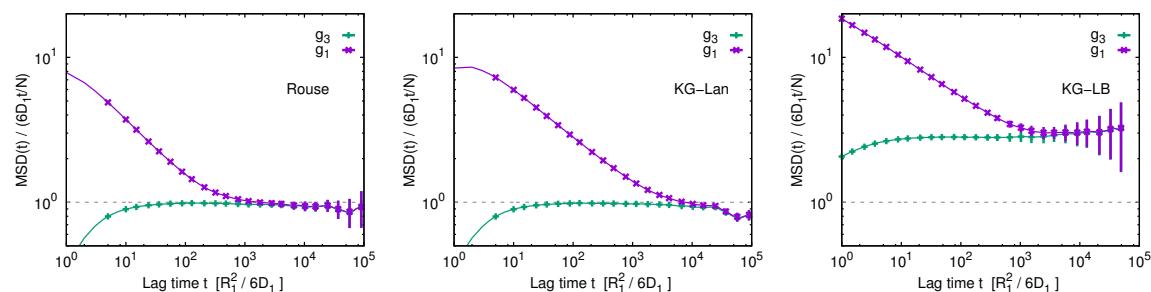

FIG. 2. Analogue of Fig. 1, showing the scaled mean squared displacement $MSD(t)/6D_N t$.

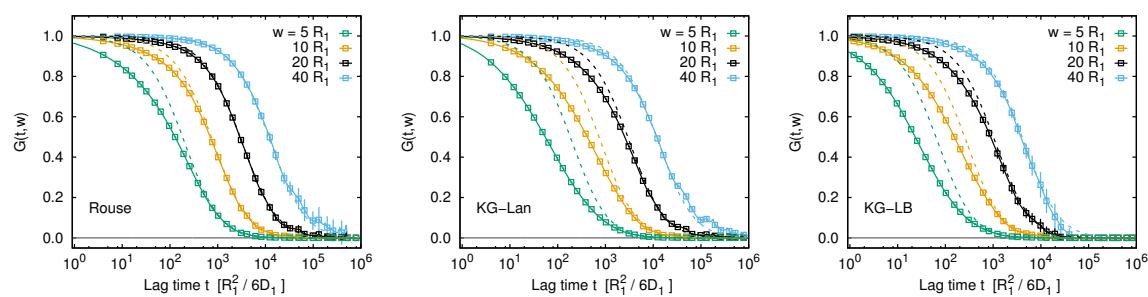

FIG. 3. The FCS correlation functions, $G(t,w)$ for all three considered models. For comparison, $G(t,w)$ of a single particle performing normal diffusion with diffusion coefficient D_N^R are shown as dashed lines.

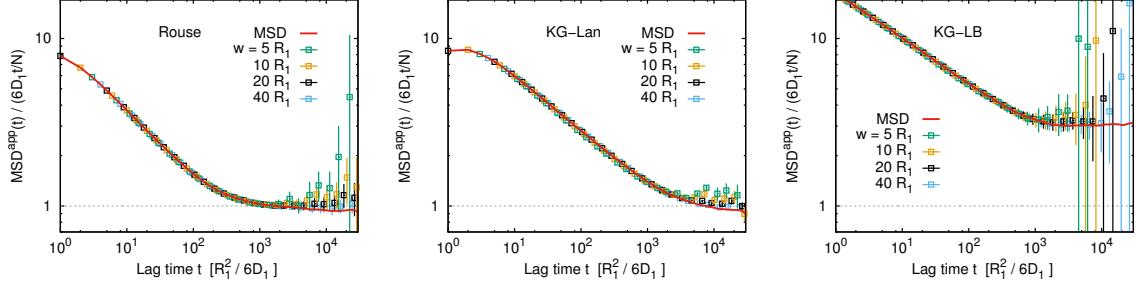

FIG. 4. The scaled apparent mean squared displacement, $MSD^{app}(t, w)$, obtained from $G(t, w)$ for all three considered models. For comparison, the true mean squared displacement, $MSD(t)$ is shown as well.

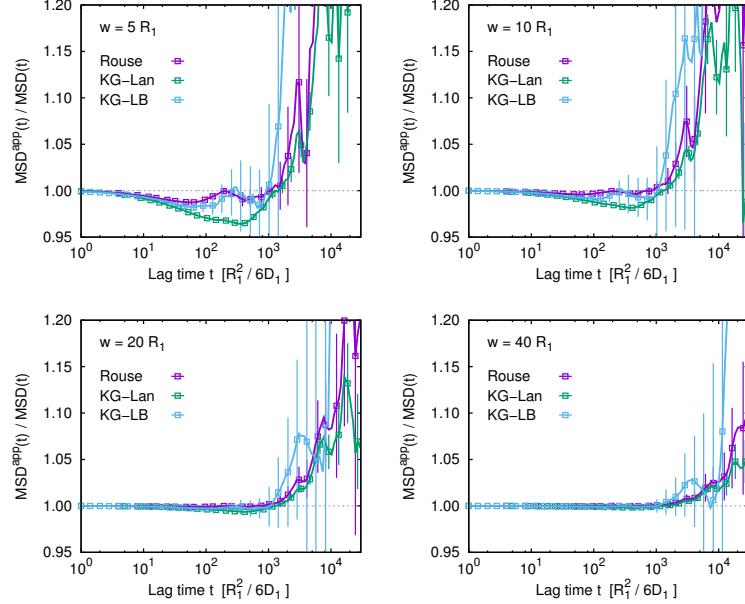

FIG. 5. The ratio of the apparent mean squared displacement, and the true one for various values of w , for all three considered models.

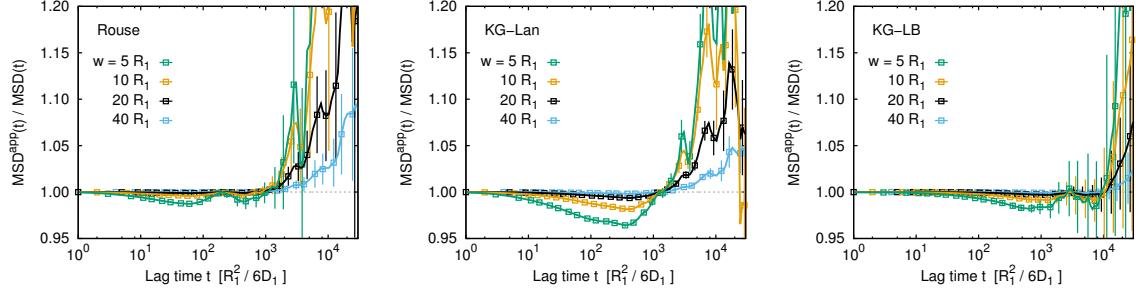

FIG. 6. The ratio of the apparent mean squared displacement, and the true one for various values of w , for all three considered models.
