## **Instrumentations and methods**

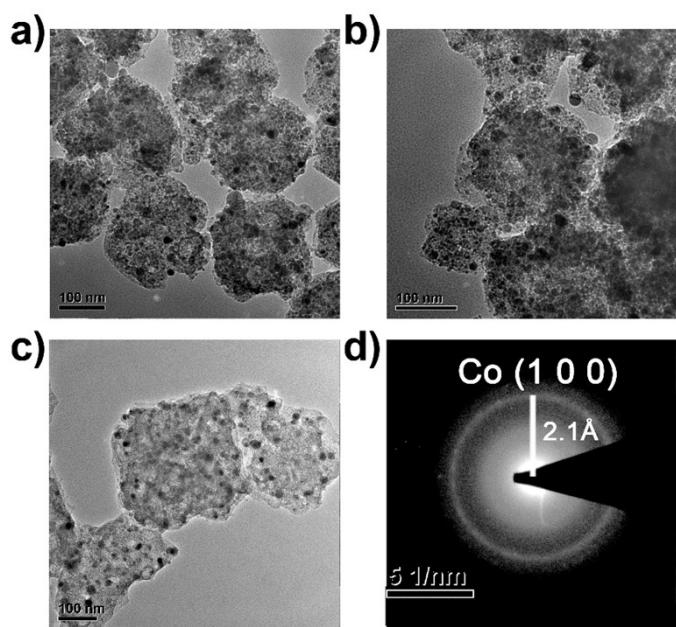

Powder X-ray diffraction (PXRD) were carried out on a Japan Rigaku DMax- $\gamma$ A rotation anode X-ray diffractometer equipped with graphite monochromatized Cu K $\alpha$  radiation ( $\lambda = 1.54 \text{ \AA}$ ). The contents of C, N, and S were quantified by Vario EL III system. The contents of Co were quantified by an inductively coupled plasma mass spectrometry (ICP-MS). The transmission electron microscopy (TEM) and EDX mapping were acquired on JEM-2010, and elemental mapping was measured on Tecnai F30 or JEM 1400 with an electron acceleration energy of 200 kV. Nitrogen sorption measurement was conducted using a Micromeritics ASAP 2020 system at 77 K. Direct current resistance tests were conducted on a Keithley 2400 Source Meter.
