

## Supporting Information for:

### End-to-end azido-pinned interlocking lanthanide squares

Xiao-Lei Li, Jianfeng Wu, Lang Zhao, Wei Shi,\* Peng Cheng, and Jinkui Tang\*

#### Experimental Section

**General.** All starting materials were of A.R. Grade and were used as commercially obtained without further purification. 4, 6-dihydrazinopyrimidine was prepared according to a previously published method.<sup>1</sup>

Elemental analyses for C, H, and N were carried out on a Perkin-Elmer 2400 analyzer. Fourier transform IR (FTIR) spectra were recorded with a Perkin-Elmer FTIR spectrophotometer using the reflectance technique (4000–300 cm<sup>-1</sup>). Samples were prepared as KBr disks. All magnetization data were recorded on a Quantum Design MPMS-XL7 SQUID magnetometer equipped with a 7 T magnet. The variable-temperature magnetization was measured with an external magnetic field of 1000 Oe in the temperature range of 1.9–300 K. The experimental magnetic susceptibility data are corrected for the diamagnetism estimated from Pascal's tables and sample holder calibration.

#### Synthesis of the Complex Dy<sub>8</sub>L<sub>6</sub>

[Dy<sub>8</sub>L<sub>6</sub>(μ<sub>2</sub>-OH)<sub>4</sub>(H<sub>2</sub>O)<sub>4</sub>(N<sub>3</sub>)<sub>4</sub>(CH<sub>3</sub>O)<sub>4</sub>]·16H<sub>2</sub>O·2CH<sub>3</sub>OH (**Dy**<sub>8</sub>**L**<sub>6</sub>).

4,6-dihydrazinopyrimidine (0.1 mmol) was dissolved in a mixture of methanol and acetonitrile (1:3, 20 mL), and then salicylaldehyde (0.2 mmol) was added to the mixture. The reaction mixture was stirred for 30 min. Then, NaN<sub>3</sub> (0.3 mmol) and Dy(NO<sub>3</sub>)<sub>3</sub>·6H<sub>2</sub>O (0.1 mmol) were added successively. The reaction mixture was stirred at room temperature for 5 h and the resultant solution was left unperturbed to allow for slow evaporation of the solvent. Green single crystals of complex **Dy**<sub>8</sub>**L**<sub>6</sub> were obtained after about one week. Yield: 25 mg, (4.9 %, based on the metal salt). Elemental analysis (%) calcd for C<sub>114</sub>H<sub>108</sub>Dy<sub>8</sub>N<sub>48</sub>O<sub>42</sub>: C, 33.2, H, 2.6, N, 16.3; found C, 33.5, H, 2.9, N, 16.8.

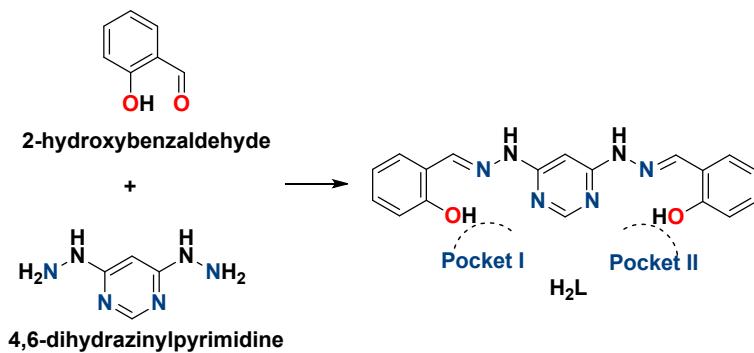

#### X-ray Crystallography.

Crystallographic data and refinement details are given in Table S1. Suitable single crystal of **Dy**<sub>8</sub>**L**<sub>6</sub> was selected for single-crystal X-ray diffraction analysis. A suitable crystal was selected and on a 'Bruker APEX-II CCD' diffractometer with graphite monochromated Mo K $\alpha$  radiation ( $\lambda = 0.71073 \text{ \AA}$ ). The crystal was kept at 100(2) K during data collection. The structure was solved by direct methods and refined by the full-matrix least-squares method based on  $F^2$  with anisotropic thermal parameters for all non-hydrogen atoms by using the SHELXS (direct methods) and refined by ShelXL (full matrix least-squares techniques) in the Olex2 package.<sup>1</sup> The locations of Dy and Br atoms were easily determined, and O, N, C atoms were subsequently determined from the difference Fourier maps. Anisotropic thermal parameters were assigned to all non-hydrogen atoms. The H atoms were introduced in calculated positions and refined with a fixed geometry with respect to their carrier atoms. CCDC 1524702 (**Dy**<sub>8</sub>**L**<sub>6</sub>) contains the supplementary crystallographic data for this paper. This data can be

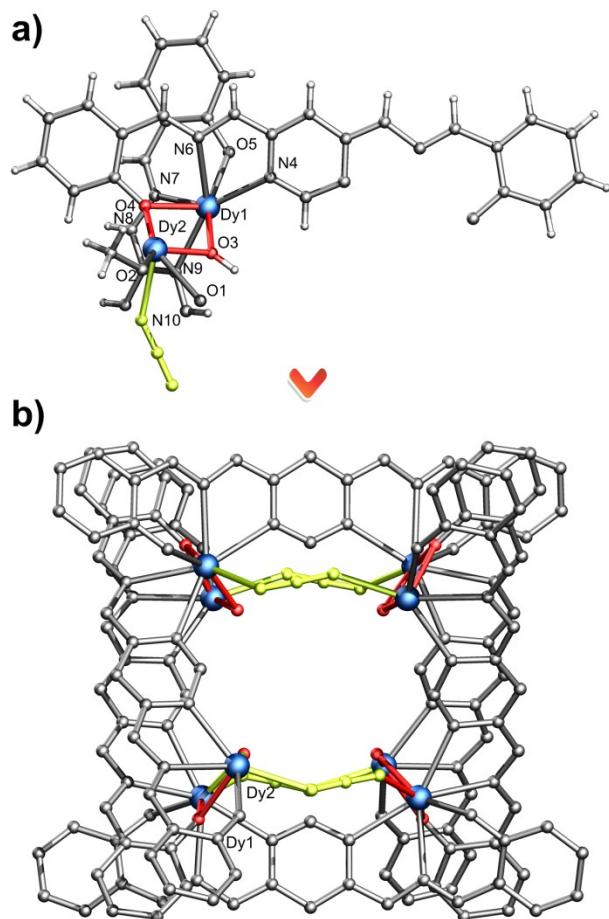

obtained free of charge from the Cambridge Crystallographic Data Centre via [www.ccdc.cam.ac.uk/data\\_request/cif](http://www.ccdc.cam.ac.uk/data_request/cif).

**Table S1.** Reported Azido-bridged lanthanides SMMs in the literature.

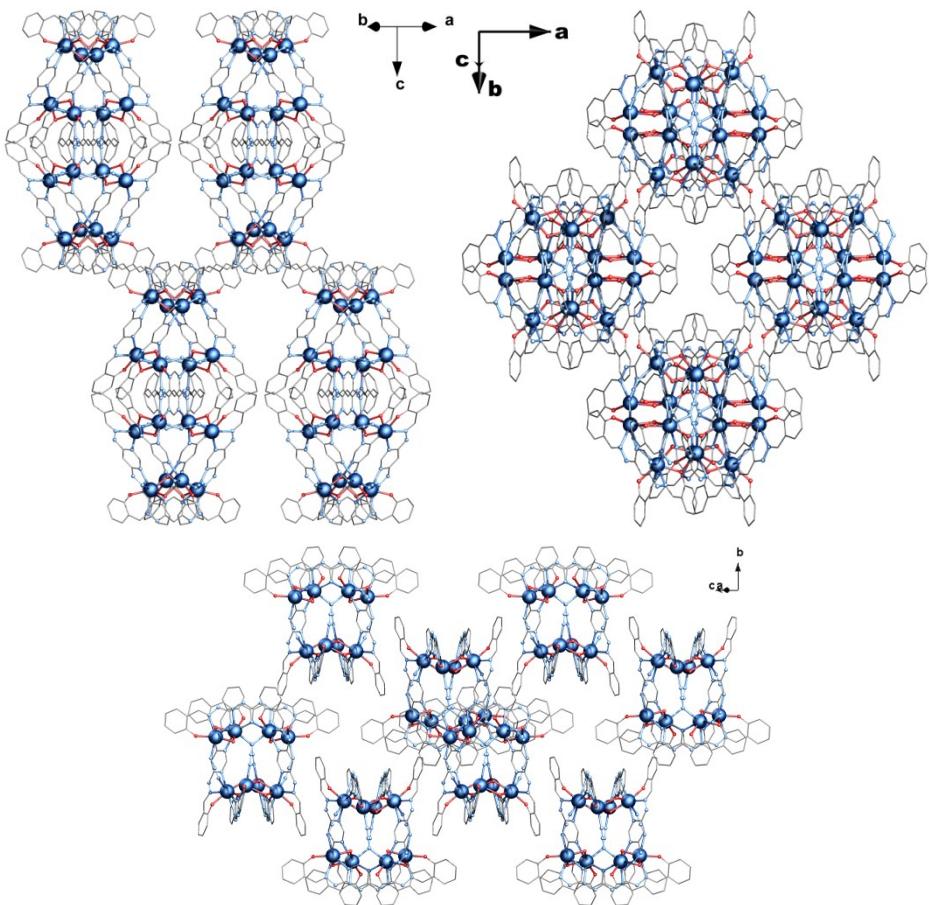

Complexe	Abbrev.	Bridged groups	Coordination mode/ $N_3^-$	$U_{\text{eff}}$ (K)	Ref.
