1. Materials and methods

Hosts **1** and **2** were prepared according to literature procedures.^{S1} Tropylium tetrafluoroborate and other reagents were commercially available and used as received. ¹H NMR spectra and 2D Noesy spectra were recorded on the Bruker® Avance III 400 MHz NMR spectrometers at 298 K. Electrospray ionization mass spectra (ESI-MS) were recorded on the Thermo Fisher® Exactive high-resolution LC-MS spectrometer. The UV-vis spectra were recorded on PerkinElmer® UV/Vis/NIR spectrometer (Lambda 950) at room temperature.

2. ^1H NMR studies on complexation between the hosts and the guest

The ^1H NMR titration experiments were carried out by gradually adding guest into the solution of the hosts. According to the changes of the chemical shift of the proton in the host, the association constants K_a were calculated by using a nonlinear curve fitting method.

8. DFT calculations for complexation between the hosts and guest

Molecular modelings of free host, free guest and the complexes were constructed by referring to the single crystal or calculated structures that involved the related interaction modes. To make sure of the accuracy, density functional theory (DFT) calculations based on the B3LYP/6-31G were carried using the Gaussian 09 program package. The actual counterions were not included in the calculations.
