ii) Synthesis of **1**

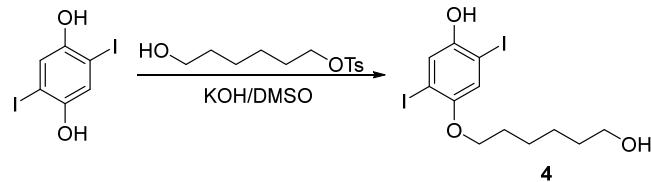

Syntheses and Spectral Characterization of new compounds.

Abbreviations: DCM = dichloromethane; DMAP = 4-dimethylaminopyridine; DMF = dimethylformamide; DTT = dithiothreitol; TTPA = 3-tritylthiopropionic acid; EDC = N-(3-Dimethylaminopropyl)-N'-ethylcarbodiimide hydrochloride; Tris = 2-amino-2-(hydroxymethyl)-1,3-propanediol; THAP = 2',4',6'-Trihydroxyacetophenone monohydrate; TEA = triethylamine; THF = tetrahydrofuran; Ts = 4-Toluenesulfonyl.

2,5-Diiodobenzene-1,4-diol, DMAP, 1,6-dibromohexane, 1-octanethiol, DTT, 1-phenyloctane, pentanoic acid, THAP, sodium iodide and cuprous iodide were purchased from Sigma-Aldrich (St. Louis, MO). EDC, TTPA and triphenylphosphine were purchased from Oakwood Chemical (Estill, SC). Iodine was purchased from Alfa Aesar (Ward Hill, MA). Palladium(II) chloride was purchased from Strem Chemicals (Newburyport, MA). Di-tert-butylpyridine was purchased from Combi-Blocks (San Diego, CA). HPLC grade solvents (DCM, chloroform, ethyl acetate, THF, TEA, ethanol, DMSO and DMF), potassium carbonate and potassium hydroxide were purchased from Fisher Scientific (Pittsburgh, PA).

Dry Solvent: Anhydrous and oxygen-free solvents were collected from a solvent column system.¹ All reactions were carried out in flame-dried glass containers under argon atmosphere.

Column Chromatography: Flash column chromatography was run on silica gel (60Å, 230-400 mesh). The eluting solvent was chosen to generate an R_f of 0.15-0.35 of the desired product. Column fractions were analyzed by thin layer chromatography (coated with fluorescent indicator F254) and visualized using a UV lamp (254nm) or phosphomolybdic acid (PMA) as stain.

4-((6-hydroxyhexyl)oxy)-2,5-diiodophenol (4). Into a 5mL microwave tube were added 2,5-diiodobenzene-1,4-diol (208mg, 0.58mmol), potassium hydroxide (40mg, 0.71mmol) and a stirring bar. The tube was sealed with an aluminum cap with septum, degassed under vacuum and refilled with argon a total of three times. Into a sealed 5mL round-bottom flask were added 6-hydroxyhexyl 4-methylbenzenesulfonate² (158mg, 0.58mmol) and DMSO (2mL). The DMSO solution was sparged with argon for 10 minutes and then transferred to the microwave tube using syringes under argon. The mixture was stirred at room temperature for 19 hours. Work-up and purification: The reaction mixture was quenched with 0.5M HCl and extracted with ethyl acetate. The organic layer was washed with

2) J. He, C. Fang, R. A. Shelp and M. B. Zimmt, *Langmuir*, **2017**, 33, 459-467.

water, brine and dried over anhydrous Na_2SO_4 . The solvent was removed under reduced pressure. The crude product was purified by a flash column (30% ethyl acetate/hexanes) to afford 4-((6-hydroxyhexyl)oxy)-2,5-diiodophenol; pale solid; Yield: 85mg (32%).

^1H NMR (400MHz, acetone-d6) δ 8.96 (br, 1H), 7.37 (s, 1H), 7.27 (d, 1H), 4.01 (t, $J = 6.4\text{Hz}$, 2H), 3.58 (t, $J = 6.2\text{Hz}$, 2H), 3.16 (br, 1H), 1.80 (quint, $J = 6.9\text{Hz}$, 2H), 1.60-1.42 (m, 6H).

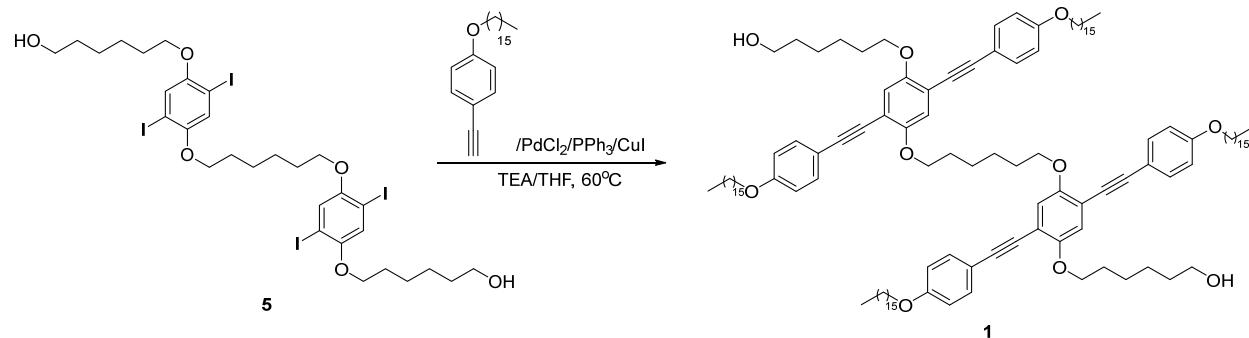

^{13}C NMR (100MHz, acetone-d6) δ 152.16, 151.71, 124.45, 122.57, 86.19, 83.27, 69.98, 61.60, 32.81, 29.12, 25.84, 25.47.

6,6'(((hexane-1,6-diylbis(oxy))bis(2,5-diido-4,1-phenylene))bis(oxy))bis(hexan-1-ol) (5). Into a 2mL microwave tube were added compound **4** (85mg, 0.18mmol), potassium carbonate (52mg, 0.38mmol) and sodium iodide (4mg, 0.027mmol). The tube was sealed with an aluminum cap with septum, degassed under vacuum and refilled with argon three times. Into a sealed 5mL round-bottom flask were added 1,6-dibromohexanes (21mg, 0.086mmol) and acetone (1mL). The acetone solution was sparged with argon for 5 minutes and then transferred to the microwave tube using syringes under argon. The reaction mixture was stirred at 65°C for 18 hours. Work-up and purification: The reaction mixture was cooled to room temperature, quenched with 0.5M HCl and extracted with ethyl acetate. The organic layer was washed with water, brine and dried over anhydrous Na_2SO_4 . The solvent was removed under reduced pressure. The crude product was purified by a flash column (30% ethyl acetate/DCM) to afford 6,6'(((hexane-1,6-diylbis(oxy))bis(2,5-diido-4,1-phenylene))bis(oxy))bis(hexan-1-ol); white solid; Yield: 58mg (67%).

^1H NMR (400MHz, CDCl_3) δ 7.19 (s, 2H), 7.18 (s, 2H), 3.98 (t, $J = 6.3\text{Hz}$, 4H), 3.95 (t, $J = 6.3\text{Hz}$, 4H), 3.69 (t, $J = 6.5\text{Hz}$, 4H), 1.86 (m, 8H), 1.68-1.43 (m, 16H).

^{13}C NMR (100MHz, CDCl_3) δ 152.83, 152.81, 122.80, 122.74, 86.36, 86.31, 70.18, 69.98, 62.92, 32.69, 29.11, 28.96, 25.91, 25.50, 25.44.

6,6'-(((hexane-1,6-diylbis(oxy))bis(2,5-bis((4-(hexadecyloxy)phenyl)ethynyl)-4,1-phenylene))bis(oxy))bis(hexan-1-ol) (1). Into a 5mL microwave tube were added compound **5** (44mg, 0.044mmol), 1-ethynyl-4-(hexadecyloxy)benzene² (72mg, 0.21mmol), palladium chloride (2mg, 0.01mmol), cuprous iodide (2mg, 0.01mmol) and triphenylphosphine (7mg, 0.03mmol). The tube was sealed with an aluminum cap with septum, degassed under vacuum and refilled with argon three times. THF (2mL) and TEA (0.5mL) were then added to the tube using syringes. The reaction mixture was sparged with argon for 5 minutes and stirred at 60°C for 16 hours. Work-up and purification: The reaction mixture was cooled to room temperature and quenched with saturated NH₄Cl solution. The mixture was extracted with DCM. The organic layer was washed with water, brine and dried over anhydrous Na₂SO₄. The solution was concentrated under reduced pressure. The crude product was purified by a flash column (2% ethyl acetate/DCM) to afford 6,6'-(((hexane-1,6-diylbis(oxy))bis(2,5-bis((4-(hexadecyloxy)phenyl)ethynyl)-4,1-phenylene))bis(oxy))bis(hexan-1-ol); yellowish solid; Yield: 52mg (63%).

¹H NMR (400MHz, CDCl₃) δ 7.48 (d, *J* = 4.4Hz, 4H), 7.46 (d, *J* = 4.4Hz, 4H), 7.00 (s, 2H), 6.99 (s, 2H), 6.88 (d, *J* = 4.4Hz, 4H), 6.84 (d, *J* = 4.4Hz, 4H), 4.04 (t, *J* = 6.3Hz, 4H), 4.03 (t, *J* = 6.2Hz, 4H), 3.99 (t, *J* = 6.6Hz, 4H), 3.92 (t, *J* = 6.6Hz, 4H), 3.66 (t, *J* = 6.5Hz, 4H), 1.92-1.28 (m, 136H), 0.90 (t, *J* = 6.8Hz, 12H).

¹³C NMR (100MHz, CDCl₃) δ 159.27, 153.50, 153.45, 132.99, 116.87, 115.38, 115.26, 114.53, 114.08, 113.98, 95.06, 94.91, 84.67, 84.61, 69.48, 68.11, 68.07, 62.93, 32.74, 31.95, 29.73, 29.69, 29.66, 29.63, 29.61, 29.46, 29.44, 29.39, 29.37, 29.33, 29.24, 26.05, 25.94, 25.54, 14.15.

MALDI-TOF Mass Spectrum (THAP matrix) 1864.0 (observed [M+H]⁺, expected 1864.4 [M+H]⁺)

iii) TOF-MS and STM Procedures

TOF-MS Procedures

- a) Sample air dried then pumped 30 minutes 5 mm Hg prior to THAP application
- b) 10-12 μ L of 5 mg/mL THAP matrix in 30/70 acetone/hexane applied and allowed to air dry
- c) TOF-MS data collected on a Bruker Daltonics Autoflex MALDI-TOF massspectrometer (Billerica, MA) running in linear mode. Sample holder (MTP PAC Frame) modifications to hold the HOPG substrate described in Langmuir 2017, 33, 459–467 (DOI: 10.1021/acs.langmuir.6b03252). HOPG substrates irradiated using the SmartbeamTM-II Nd:YAG laser (355 nm) 6_ultra laser profile operating at 1 kHz. Data was collected in positive ion mode using 500 laser shots at 70% of full laser power (60% for compound **1**), a TOF accelerating voltage of 19.45 kV, a grid voltage of 18.1 kV and pulsed ion extraction time of 90 μ s. Instrument calibration for HOPG within the pressure mounted cell was performed using Bruker Daltonics Peptide Calibration Standard II.

STM Procedures

3-5 μ L of 12 μ M **1** (25% CHCl₃ / phenyloctane) was drop cast on a freshly peeled 12 mm x 12 mm HOPG substrate. After sitting five minutes, the monolayer / graphite was rinsed with 20 μ L phenyloctane. For annealed samples (Fig. 2), the graphite was placed monolayer side down in 10 μ L of phenyloctane or 10% 1-nanol / phenyloctane in a sealable chamber and annealed two hours at 60°C. The sample was rinsed with 20 μ L phenyloctane before STM or performing reaction chemistry.

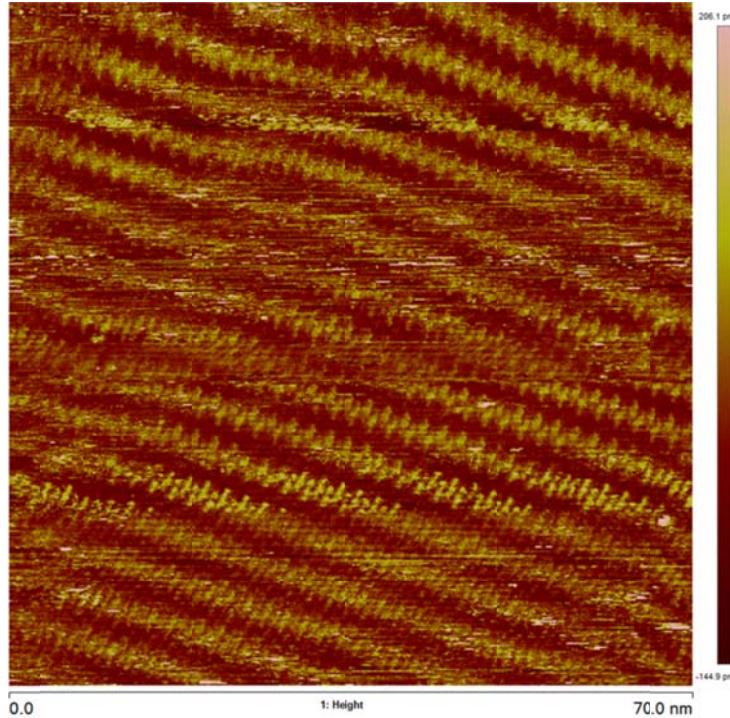

Scanning was initiated using a freshly cut 80/20 Pt/Ir tip (Bias voltage -1.2 V, set current 30 - 35 pA, scan rate, 5 - 7 Hz). All STM data was collected on a VEECO MS-10 STM instrument. Collected images were flattened.

iv) **Fig. S1.** STM image (70nm x 70 nm) of monolayer self-assembled by compound **1**.

(1.4V, 43 pA, 2.77 Hz)

Drop cast 3 μ L of 12.5 μ M **1** in 25% CHCl₃ / phenyloctane on freshly cleaved HOPG;

Annealed 2 hrs then rinsed rinsed with 20 μ L phenyloctane prior to imaging.

d) Photograph of THAP coated **1** / HOPG substrate after 36 TOF-MS measurements in c).

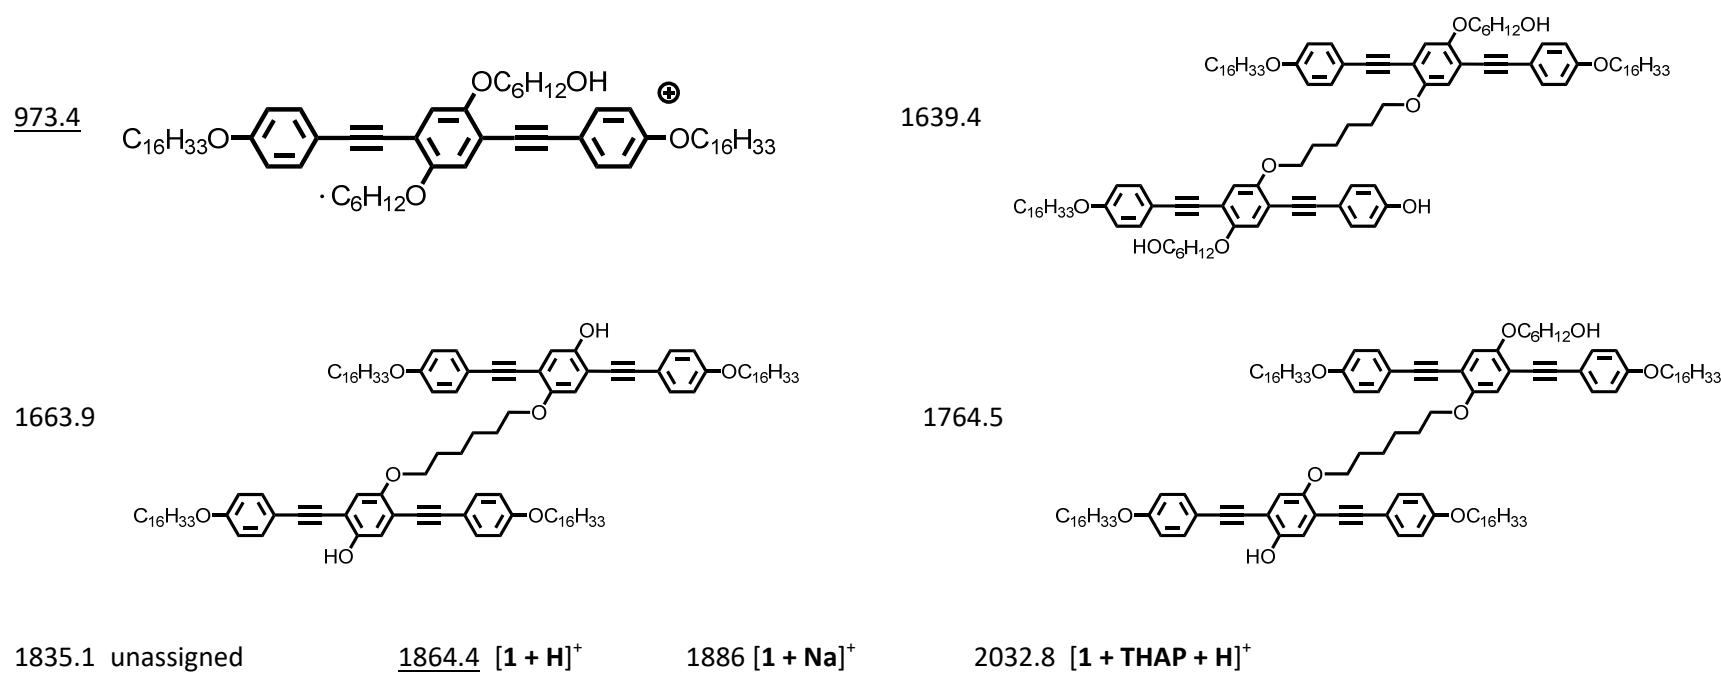

A thin film of THAP was applied to the monolayer **1** / HOPG substrate using 10 μ L of 5 mg/mL THAP in 30/70 acetone/hexane and allowed to air dry. Regions irradiated to collect mass spectra appear as dark spots ($\sim 50\mu\text{m}$ diameter). The horizontal spacing between spots in the left (right) two columns is 1000 μm . The vertical spacing between spots in a column is 500 μm .

d) TOF mass spectra 1.8-2.5 kD region (**1 + β-TTP only**): 18 samples (Intensity (y) axis scale 0-60000)

viii) Fig. S5. TOF mass spectra following in-situ reaction of monolayer **1** to form monolayer **2b**

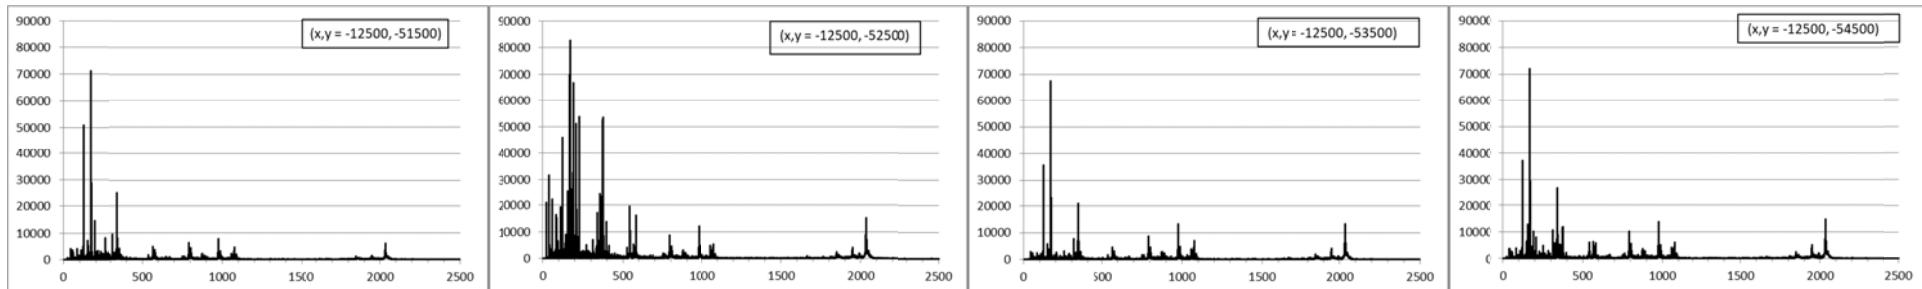

TOF mass spectra after immersing a monolayer of **1** on HOPG in a DCM solution with 40 mM valeric acid, 40 mM EDC and 40 mM EDC for 30 minutes. Two spectral regions are presented for each spot sampled: the 0-2.5kD region and the 1.8-2.5 kD region.

Procedure: monolayer of **1** immersed in DCM containing 40 mM valeric acid, 40 mM EDC and 40 mM EDC for 0.5 hr. Monolayer was rinsed with 0.1 mL EtOH to remove reagents. After draining the EtOH and air drying, 10 μ L of 5 mg / mL THAP in 30% acetone / hexane was applied to form a thin THAP film.

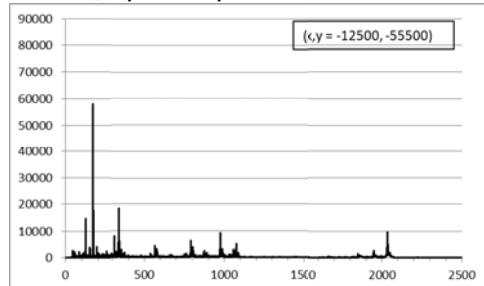

a) Summary and statistical analysis of mass spectra peak intensities from incubating a monolayer of **1** with valenic acid / EDC / DMAP solution.

21 hr 60°C oDCB	10	2040	[3-H ₂ + H] ⁺	6400	9700	8400 (0.82)	1300	0.15

b) Freshly prepared **3-H₂** monolayer on HOPG without oDCB incubation of **(3)_x** precursor: 20 sampled spots. 0-2.5kD region and 1.8-2.6 kD region of the average spectrum collected from five spots at x = -12500 and at x = -13500 from two sides of HOPG (Intensity (y) axis scale 0-90000; 0-15000 for the averaged spectra).

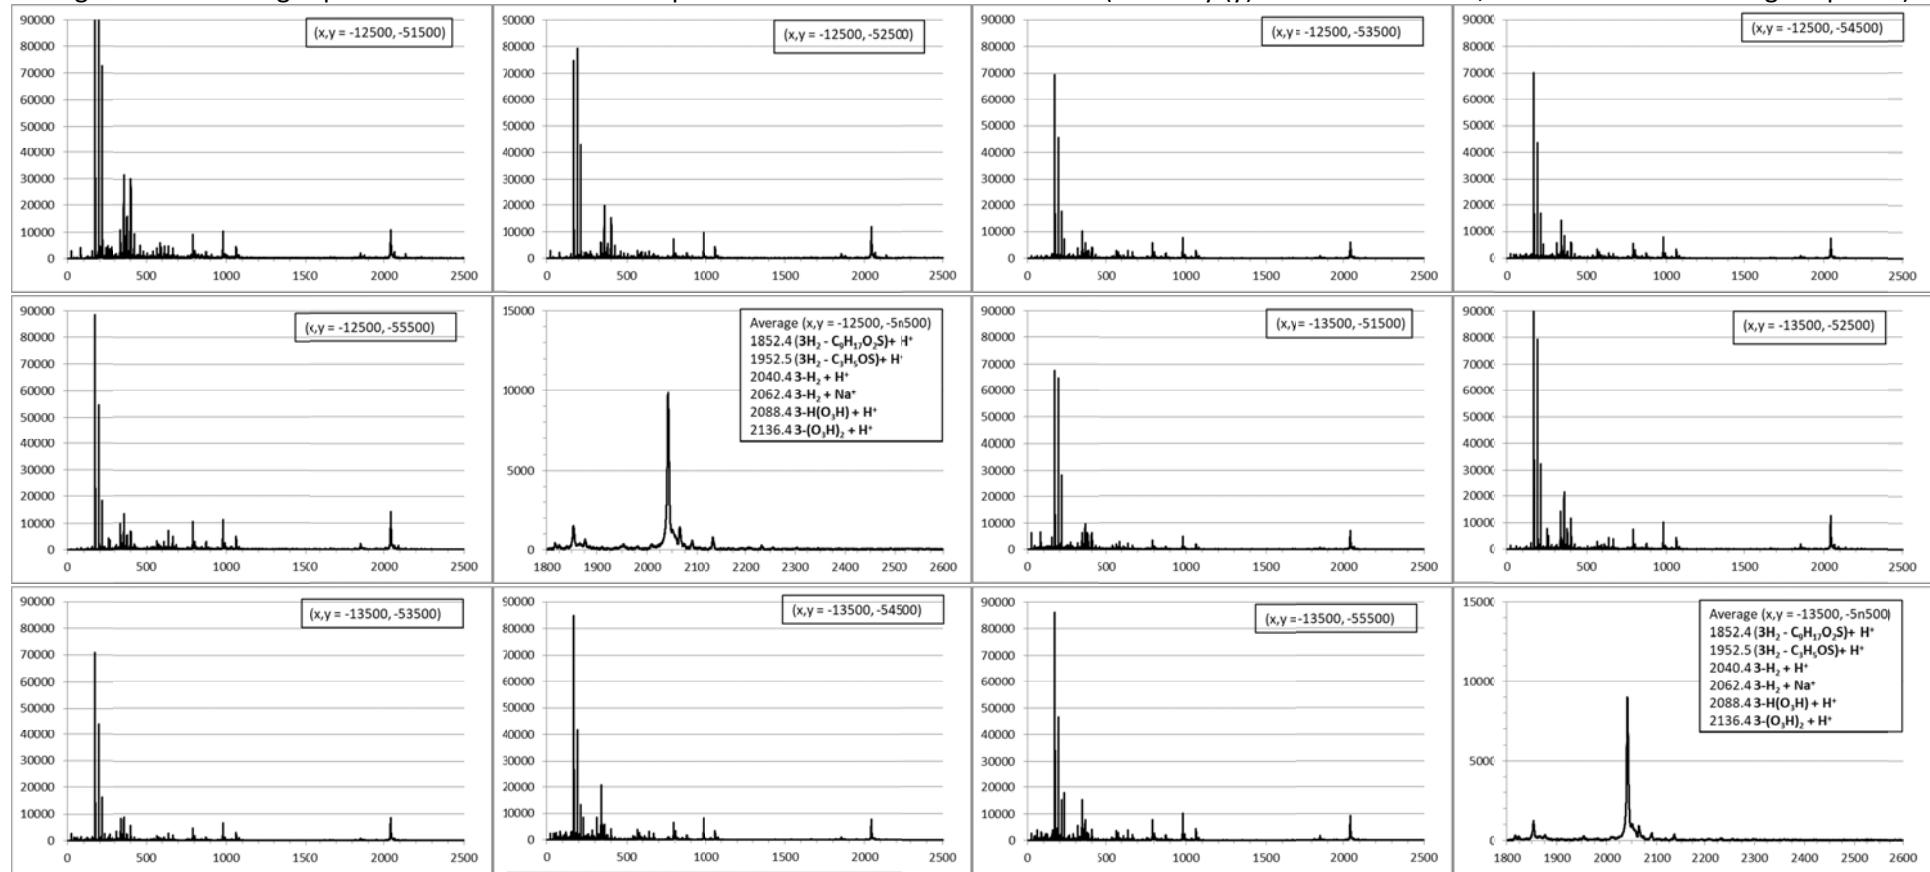

Supporting Information - Zipping and Unzipping Monolayers: Switchable Monolayer Oligomerization and Adhesion via Thiol - Disulfide Interconversion.

Jian He, Kyle J. Myerson and Matthew B. Zimmt
