## Materials and reagents

(2S,2'S)-1,1'-(1,4,7,10-tetraazacyclododecane-1,7-diyl)bis(propan-2-ol) ${ }^{1} \quad$ (1) and (S)-1-chloro-3-(tritylthio)propan-2-ol (2) were prepared following literature procedures. All other starting materials, reagents and solvents were obtained from commercial suppliers and were of general reagent or analytical grade and used without further purification.

## Instruments

All 400 MHz NMR spectra were recorded on a Bruker Avance III Nanobay spectrometer. NMR data was acquired using TOPSPIN/ICONNMR (Bruker), processing and plotting of the acquired data were performed using MestReNova software. Chemical shifts are quoted in units of parts per million (ppm) and were referenced internally to the residual proteo-solvent resonance; ${ }^{1} \mathrm{H}$ NMR: $\mathrm{CDCl}_{3}(\delta 7.26)$, $\mathrm{D}_{2} \mathrm{O}(\delta 4.79) ;{ }^{13} \mathrm{C}$ NMR: $\mathrm{CDCl}_{3}(\delta 77.16) .{ }^{3}$ Multiplicity for NMR resonances are abbreviated as; s, singlet; d, doublet; t, triplet; q, quartet; p, pentet; m, multiplet, app, apparent; br, broad. LCMS were acquired on an Agilent 1220/6120 LCMS system, using ChemStation software for instrument control and data analysis. HRMS were acquired on an Agilent 6224 TOF LCMS mass spectrometer, coupled to an Agilent 1290 Infinity (Agilent, Palo Alto, CA). Acquisition was performed using Agilent Mass Hunter Data Acquisition software and analyzed using Mass Hunter Qualitative Analysis software. Preparative reverse-phase HPLC was performed on an Agilent 1260 Prep HPLC using an Alltima C8 column ( $250 \mathrm{~mm} \times 22 \mathrm{~mm}, 5$ micron).

Scheme S1. Synthesis of lanthanide complexes of T7. Reagents and conditions: (i) $\mathrm{K}_{2} \mathrm{CO}_{3}, \mathrm{ACN}$, reflux, $72 \mathrm{~h}, 58 \%$; (ii) $\mathrm{LnCl}_{3}$, MeOH , reflux, $2 \mathrm{~h}, 2,2^{\prime}$-pyridyldisulfide, silver nitrate, $\mathrm{RT}, 2 \mathrm{~h}, 14 \%$.

## (2R,2'R)-3,3'-(4,10-bis((S)-2-Hydroxypropyl)-1,4,7,10-tetraazacyclododecane-1,7-diyl)bis(1-

 (tritylthio)propan-2-ol), 3
$\mathrm{K}_{2} \mathrm{CO}_{3}(262 \mathrm{mg}, 1.90 \mathrm{mmol})$ was added to a solution of $\mathbf{1}(110 \mathrm{mg}, 0.38 \mathrm{mmol})$ and $\mathbf{2}(350 \mathrm{mg}, 0.95$ $\mathrm{mmol})$ in $\mathrm{ACN}(6 \mathrm{~mL})$ and heated to reflux for 24 h , after which additional 5 ( $350 \mathrm{mg}, 0.95 \mathrm{mmol}$ ) was added and reflux continued for a further 48 h . After cooling to room temperature, insoluble salts were removed by filtration and the filtrate concentrated under reduced pressure. The resulting crude residue was purified by silica flash chromatography ( 0 to $5 \% \mathrm{MeOH}$ and $0.5 \% \mathrm{NH}_{3}$ in $\mathrm{CHCl}_{3}$ ) to yield 6 as an off-white foam. Yield: $212 \mathrm{mg}(58 \%) .{ }^{1} \mathbf{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.42(\mathrm{~m}, 12 \mathrm{H}), 7.27(\mathrm{~m}$, $12 \mathrm{H}), 7.19(\mathrm{~m}, 6 \mathrm{H}), 5.33(\mathrm{br}, 2 \mathrm{H}), 4.80(\mathrm{br}, 2 \mathrm{H}), 3.78(\mathrm{br}, 2 \mathrm{H}), 3.41(\mathrm{br}, 2 \mathrm{H}), 2.79(\mathrm{~m}, 7 \mathrm{H}), 2.46(\mathrm{~m}$,
$3 \mathrm{H}), 2.17(\mathrm{~m}, 8 \mathrm{H}), 1.98(\mathrm{~m}, 8 \mathrm{H}), 1.05(\mathrm{~m}, 6 \mathrm{H}) .{ }^{13} \mathbf{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 144.97(C), 129.80$ $(\mathrm{CH}), 128.06(\mathrm{CH}), 126.77(\mathrm{CH}), 66.87\left(\mathrm{C}(\mathrm{Ph})_{3}\right), 66.00(\mathrm{CH}), 62.70(\mathrm{CH}), 62.53,60.06,52.63,49.94$, 37.79 (previous 5 peaks $C \mathrm{H}_{2}$ ), $22.40\left(\mathrm{CH}_{3}\right)$. HRMS (ESI) $m / z$ calcd $[\mathrm{M}+\mathrm{H}]^{+} \mathrm{C}_{58} \mathrm{H}_{73} \mathrm{~N}_{4} \mathrm{O}_{4} \mathrm{~S}_{2}: 953.5073$, found: 953.5084.

## Formation of metal complexes

A solution of $3(15 \mathrm{mg}, 0.016 \mathrm{mmol})$ and $\mathrm{YCl}_{3}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}(7 \mathrm{mg}, 0.024 \mathrm{mmol})$ in $\mathrm{MeOH}(2 \mathrm{~mL})$ was heated at $60{ }^{\circ} \mathrm{C}$ for 2 h . After cooling to room termperature, silver nitrate ( $27 \mathrm{mg}, 0.16 \mathrm{mmol}$ ) and 2,2'-dipyridyldisulfide ( $21 \mathrm{mg}, 0.096 \mathrm{mmol}$ ) were added and the mixture stirred vigorously for 2 h at room temperature, during which time a cloudy beige precipitate that gradually turned grey formed. Insoluble material was sedimented by transfering the reaction mixture to a 15 mL centrifuge tube and centrifugation at 2000 rcf for 5 min . The supernatant was removed and syringe filtered through a 45 $\mu \mathrm{m}$ membrane, before contrentration under reduced pressure. The resulting residue was purified by reverse-phase HPLC ( $0.1 \%$ TFA and a $5-100 \% \mathrm{ACN}$ gradient over 30 min on a C8 preparative column). Fractions containing pure product were lyophilised to afford $\mathbf{T 7}-\mathbf{Y}^{3+}$ as a white solid. Yield: $3 \mathrm{mg}\left(14 \%\right.$, based on a pentatrifluoroacetate salt). ${ }^{\mathbf{1}} \mathbf{H} \mathbf{~ N M R ~}\left(400 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}\right) \delta 8.52(\mathrm{dd}, J=5.3,0.9$ $\mathrm{Hz}, 2 \mathrm{H}), 8.06(\mathrm{~m}, 2 \mathrm{H}), 7.98(\mathrm{~d}, J=8.2 \mathrm{~Hz}, 2 \mathrm{H}), 7.51$ (ddd, $J=7.4,5.3,1.1 \mathrm{~Hz}, 2 \mathrm{H}), 4.65(\mathrm{~m}, 2 \mathrm{H})$, $4.57(\mathrm{~m}, 2 \mathrm{H}), 3.50(\mathrm{~m}, 6 \mathrm{H}), 3.32(\mathrm{~m}, 4 \mathrm{H}), 3.17(\mathrm{~m}, 2 \mathrm{H}), 3.06-2.91(\mathrm{~m}, 4 \mathrm{H}), 2.77(\mathrm{dd}, J=12.9,4.1$ $\mathrm{Hz}, 2 \mathrm{H}), 2.52-2.31(\mathrm{~m}, 8 \mathrm{H}), 2.26(\mathrm{br} \mathrm{d}, J=13.8 \mathrm{~Hz}, 2 \mathrm{H}), 1.27(\mathrm{~d}, J=5.9 \mathrm{~Hz}, 6 \mathrm{H})$. HRMS (ESI) $\mathrm{m} / \mathrm{z}$ calcd $[\mathrm{M}+\mathrm{H}]^{+} \mathrm{C}_{30} \mathrm{H}_{48} \mathrm{~N}_{6} \mathrm{O}_{4} \mathrm{~S}_{4} \mathrm{Y}$ : 773.1673 , found 773.1687.

The $\mathrm{Tm}^{3+}$ and $\mathrm{Yb}^{3+}$ complexes of $\mathbf{T} 7$ were formed in an analagous manner to the $\mathrm{Y}^{3+}$ complexes. $\mathbf{T 8}$ and its lanthanide complexes were synthesised following the same methods used to synthesise $\mathbf{T} 7$, with the replacement of ( $S$ )-propylene oxide and ( $S$ )-epichlorohydrin (for the synthesis of $\mathbf{1}$ and $\mathbf{3}$ ) with their commerically available enantiomers. HRMS and ${ }^{\mathbf{1}} \mathbf{H}$ NMR of the $\mathrm{Yb}^{3+}$ complexes of $\mathbf{T} 7$ are shown in Figures S1 and S3.

Figure S1. High-resolution mass spectrum of $\mathbf{T 7}-\mathbf{Y b}^{\mathbf{3 +}}$.
Table S1. Predicted masses of T7-Yb ${ }^{3+}$.

| Complex | Chemical formula | Predicted masses (relative abundance) ${ }^{\mathbf{a}}$ |
| :--- | :--- | :--- |
| $\mathbf{T 7 - \mathbf { Y b } ^ { 3 + }}$ | $\left[\mathrm{C}_{30} \mathrm{H}_{48} \mathrm{~N}_{6} \mathrm{O}_{4} \mathrm{~S}_{4} \mathrm{Yb}\right]^{+}$ | $858.2003(100.0 \%), 856.1979(68.6 \%), 857.1997(50.7 \%)$, |
|  |  | $855.1978(44.9 \%), 860.2041(40.1 \%), 859.2037(32.4 \%)$, |
|  |  | $857.2012(22.3 \%), 860.1961(18.1 \%), 858.2030(16.4 \%)$, |
|  |  | $856.2012(14.6 \%)$. |

${ }^{\text {a }}$ Only masses of the 10 highest abundance predicted species are listed.

Figure S2. 1D ${ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$ NMR spectra of $\mathbf{3}$.

## Ubiquitin E24C/A28C expression, purification and tagging

Uniformly ${ }^{15} \mathrm{~N}$-labelled ubiquitin E24C/A28C prepared as described. ${ }^{4}$ The protein was first reduced by stirring with 20 equivalents of DTT for 1 h at room temperature. The protein was then passed through a PD 10 column equilibrated with degassed buffer ( 50 mM HEPES, pH 8.0 ). Five equivalents of $\mathbf{T 7}$ or $\mathbf{T 8}$ loaded with $\mathrm{Tm}^{3+}, \mathrm{Yb}^{3+}$ or $\mathrm{Y}^{3+}$ were diluted in $300 \mu \mathrm{~L}$ of buffer and added to the protein, and the solutions stirred over ice for 1 h . Excess tag was removed by passage through a PD10 column equilibrated with either 50 mM HEPES, pH 8.0 , or 50 mM MES, pH 6.5 and the eluate concentrated in an Amicon ultrafiltration centrifugal tube with a molecular weight cut-off of 3 kDa , to a final protein concentration of approximately $100 \mu \mathrm{M}$. Prior to NMR measurements, each sample was made to $10 \% \mathrm{D}_{2} \mathrm{O}(\mathrm{v} / \mathrm{v})$.

## HPPK K76C/C80 expression, purification and tagging

The HPPK 76C/C80 mutant gene cloned into a pET28a vector was purchased from Geneart.
Uniformly ${ }^{15} \mathrm{~N}$-labelled HPPK 76C/C80 was expressed and purified following established protocols for the wild-type protein. ${ }^{5}$

Purified, uniformly ${ }^{15} \mathrm{~N}$-labelled HPPK K76C/C80 was passed through a PD10 column equilibrated with degassed buffer ( 50 mM HEPES, pH 8.0 ) to remove DTT present in the storage buffer. The eluate was then made to 10 mM magnesium chloride and $100 \mu \mathrm{M} \alpha, \beta$-methyleneadenosine ${ }^{\prime}$ 'triphosphate. Three equivalents of $\mathbf{T 8}$ loaded with $\mathrm{Tm}^{3+}, \mathrm{Yb}^{3+}$ or $\mathrm{Y}^{3+}$ were diluted in $300 \mu \mathrm{~L}$ of buffer and added to the protein, and the solutions stirred over ice for 15 min . Excess tag was removed by passage through a PD10 column ( 50 mM HEPES, pH 8.0 ). The eluate was again made to 10 mM magnesium chloride and $100 \mu \mathrm{M} \alpha, \beta$-methyleneadenosine 5'-triphosphate, before concentrating in an Amicon ultrafiltration centrifugal tube with a molecular weight cutoff of 3 kDa , to a final protein concentration of approximately $100 \mu \mathrm{M}$. Prior to NMR measurements, the samples were made to 1 $\mathrm{mM} \alpha, \beta$-methyleneadenosine 5 '-triphosphate and $400 \mu \mathrm{M}$ of 8-mercaptoguanine (a small molecule HPPK inhibitor) and the sample adjusted to $10 \% \mathrm{D}_{2} \mathrm{O}(\mathrm{v} / \mathrm{v})$.

## Protein NMR spectroscopy and $\Delta \chi$-tensor and alignment tensor determination

Spectra of differently tagged ubiquitin E24C/A28C and HPPK K76C/C80 samples were recorded at $25^{\circ} \mathrm{C}$ and $22^{\circ} \mathrm{C}$, respectively, on a Bruker Avance 600 MHz NMR spectrometer equipped with a cryogenic probe and Z axis gradient. ${ }^{1} \mathrm{H}^{\mathrm{N}}$ PCSs and ${ }^{1} D_{\mathrm{HN}}$ couplings were measured by recording ${ }^{15} \mathrm{~N}$ -fast-HSQC and IPAP-[ $\left.{ }^{15} \mathrm{~N},{ }^{1} \mathrm{H}\right]$-HSQC spectra. Data were processed with NMRPipe ${ }^{6}$ and analyzed with SPARKY.7

Calculation of $\Delta \chi$-tensors was carried out within the program Numbat. ${ }^{8}$ The $\Delta \chi$-tensors were fitted to the first conformer of the NMR structure of ubiquitin (PDB 2MJB ${ }^{9}$ ) or the X-ray crystal structure of HPPK (PDB 3QBC ${ }^{5}$ ). Unambiguous PCS assignments were used to calculate an initial estimate of the $\Delta \chi$-tensor, which was used to predict PCSs of other nuclei to assist the assignment of further PCSs and refine the $\Delta \chi$-tensors in an iterative manner. The measured PCSs are listed in Tables S4 and $\mathbf{S 5}$.

Backbone amide ${ }^{1} D_{\mathrm{HN}}$ RDCs were fitted to the first conformer of the NMR structure of ubiquitin (PDB 2MJB ${ }^{9}$ ) or the X-ray crystal structure of HPPK ( $\mathrm{PDB} 3 \mathrm{QBC}^{5}$ ) using single value decomposition via the "-bestFit" flag in PALES. ${ }^{10}$ The measured RDCs are listen in Tables S6.

| ${ }^{\text {a }}$ The axial and rhombic components of the $\Delta \chi$-tensors are reported in units of $10^{-32} \mathrm{~m}^{3}$, and the Euler angles in degrees, using the $z y z$ convention and unique tensor representation. ${ }^{8}$ Standard deviations (in brackets) were determined from random removal of $10 \%$ of the PCSs and recalculating the $\Delta \chi$-tensors 1,000 times. Quality factors ( $Q$ ) were calculated as the root-mean-square deviation between the experimental and back-calculated PCSs divided by the root-mean-square of the experimental PCSs. Metal coordinates ( $x, y, z$ ) are reported relative to the NMR structure of ubiquitin (PDB ID 2MJB ${ }^{9}$ ) or the X-ray crystal structure of HPPK ( $\mathrm{PDB} 3 \mathrm{QBC}^{5}$ ). |  |  |  |  |  |  |  |  |  |  |  |  |  |

Figure S4. Correlations between experimental and calculated PCSs for T7- and T8-tagged ubiquitin E24C/A28C and HPPK S112C/C80A, loaded with $\mathrm{Tm}^{3+}$ (green) or $\mathrm{Yb}^{3+}$ (red). Solid lines represent perfect correlation.

Figure S5. Overlays of ${ }^{15} \mathrm{~N}$-HSQC spectra of T7-tagged ubiquitin E24C/A28C, loaded with either $\mathrm{Y}^{3+}$ (blue), $\mathrm{Tm}^{3+}$ (green) or $\mathrm{Yb}^{3+}$ (red). The spectra were recorded at $25{ }^{\circ} \mathrm{C}$ and pH 6.5 (top) or pH 8.0 (bottom), at a ${ }^{1} \mathrm{H}$ NMR frequency of 600 MHz .

Figure S6. Overlays of ${ }^{15} \mathrm{~N}$-HSQC spectra of T8-tagged ubiquitin E24C/A28C, loaded with either $\mathrm{Y}^{3+}$ (blue), $\mathrm{Tm}^{3+}$ (green) or $\mathrm{Yb}^{3+}$ (red). The spectra were recorded at $25{ }^{\circ} \mathrm{C}$ and pH 6.5 (top) or pH 8.0 (bottom), at a ${ }^{1} \mathrm{H}$ NMR frequency of 600 MHz .

Figure S7. Overlays of ${ }^{15} \mathrm{~N}$-HSQC spectra of T8-tagged HPPK K76C/C80, loaded with either $\mathrm{Y}^{3+}$ (blue), $\mathrm{Tm}^{3+}$ (green) or $\mathrm{Yb}^{3+}$ (red). The spectra were recorded at $22{ }^{\circ} \mathrm{C}$ and pH 8.0 at a ${ }^{1} \mathrm{H}$ NMR frequency of 600 MHz , in the presence of $10 \mathrm{mM} \mathrm{MgCl}_{2}, 1 \mathrm{mM} \alpha, \beta$-methyleneadenosine $5^{\prime}$ trisphosphate and $400 \mu \mathrm{M}$ of a small-molecule inhibitor, 8-mercaptoguanine.

Figure S8. Overlays of ${ }^{15} \mathrm{~N}$-HSQC spectra of T7-tagged HPPK K76C/C80, loaded with either $\mathrm{Y}^{3+}$ (blue) or $\mathrm{Tm}^{3+}$ (green). The spectra were recorded at $22^{\circ} \mathrm{C}$ and pH 8.0 at a ${ }^{1} \mathrm{H}$ NMR frequency of 600 MHz , in the presence of $10 \mathrm{mM} \mathrm{MgCl} 2,1 \mathrm{mM} \alpha, \beta$-methyleneadenosine 5 '-trisphosphate and $400 \mu \mathrm{M}$ of a small-molecule inhibitor, 8-mercaptoguanine.

Figure S9. Modelled and PCS-determined metal ion positions. Cloud of 400 metal positions (cyan) as modelled in Xplor-NIH. A) T7 (top) and T8 (bottom) attached to ubiquitin. The larger spheres are the PCS determined common metal ion position (for each tag loaded with either $\mathrm{Yb}^{3+}$ or $\mathrm{Tm}^{3+}$ ) and recorded at pH 8 (magenta) and pH 6.5 (pink) respectively. The sidechains of Cys 24 and Cys 28 are shown in yellow. B) T8 (top) and T7 (bottom) attached to HPPK showing the PCS determined metal position (magenta) and the sidechains of Cys76 and Cys80 shown in yellow.

Figure S10. Correlations between PCSs measured with T7- and T8-tagged HPPK K76C/C80 loaded with $\mathrm{Tm}^{3+}$. Only PCSs that were measured with both tags are shown. The solid line represents perfect correlation.

Table S3 Alignment tensor parameters for T8-Tm ${ }^{3+}$-tagged ubiquitin E24C/A28C and HPPK K76C/C80a

| Protein | Tag | \# RDC | $\mathrm{A}_{\mathrm{ax}}$ | $\mathrm{A}_{\mathrm{rh}}$ | $Q$ | $\alpha$ | $\beta$ | $\gamma$ | $\Delta \chi_{\mathrm{ax}}{ }^{\mathrm{b}}$ | $\Delta \chi_{\mathrm{rh}}{ }^{\mathrm{b}}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Ubi | $\mathrm{T} 8-\mathrm{Tm}^{3+}$ | 24 | -9.8 | -3.2 | 0.23 | 107 | 69 | 111 | -38.2 | -12.5 |
| HPPK | $\mathrm{T} 8-\mathrm{Tm}^{3+}$ | 66 | 13.3 | 2.8 | 0.12 | 13 | 146 | 53 | 51.3 | 10.8 |

${ }^{a}$ The axial and rhombic components of the alignment tensor are reported in units of $10^{-4}$ and the Euler angles in degrees, using the $z y z$ convention, values were determined by fitting the measured RDCs to the NMR structure of ubiquitin (PDB ID 2MJB ${ }^{9}$ ) or the X-ray crystal structure of HPPK (PDB ID 3QBC ${ }^{5}$ ) respectively, using the "-bestFit" flag within PALES. ${ }^{10}$ Quality factors $(Q)$ were calculated as the root-mean-square deviation between the experimental and back-calculated RDCs divided by the root-mean-square of the experimental RDCs.
${ }^{\mathrm{b}} \Delta \chi$-Tensor parameters in units of $10^{-32} \mathrm{~m}^{3}$ determined from the $\mathrm{A}_{\mathrm{ax}}$ and $\mathrm{A}_{\mathrm{rh}}$ using Equation S 1 .

Equation S1. For comparison of $A_{a x, r h}$ and $\Delta \boldsymbol{\gamma}_{\mathrm{ax}, \text { rh }}$
$\Delta \chi_{a x, r h}=A_{a x, r h} \frac{15 \mu_{0} K T}{B_{0}^{2}}$
where $B_{0}$ is the field strength $(14.1 \mathrm{~T}), \mu_{0}$ is the magnetic permeability of vacuum $\left(12.566 \times 10^{-7} \mathrm{~T}^{2}\right.$ $\left.\mathrm{m}^{3} \mathrm{~J}^{-1}\right), k$ is the Boltzmann constant $\left(1.38 \times 10^{-23} \mathrm{~J} \mathrm{~K}^{-1}\right), T$ is temperature (in Kelvin), $\Delta \chi_{\mathrm{ax}, \mathrm{rh}}$ are the axial and rhombic components of the magnetic susceptibility anisotropy tensor (in $\mathrm{m}^{3}$ ) respectively and $\mathrm{A}_{\mathrm{ax}, \mathrm{rh}}$ are the axial and rhombic components of the alignment tensor respectively.

Figure S11. Correlations between experimental and calculated ${ }^{1} D_{\mathrm{HN}}$ RDCs recorded at a ${ }^{1} \mathrm{H}$ NMR frequency of 600 MHz and pH 8.0 for $\mathbf{T 8}-\mathbf{T m}^{3+}$-tagged ubiquitin E24C/A28C (left) and HPPK K76C/C80A (right).Solid lines represent perfect correlation.

Figure S12. Orientations of the principal axes of the $\Delta \chi$ - (left) and alignment (right) tensors. The points show where the principal axes of the tensors penetrate the sphere with the axes colored as follows: $z$ (blue), $y$ (green), $x$ (red). For the $\Delta \chi$-tensors, 1000 replicates with a random $10 \%$ of the PCS data removed each time are shown. For the alignment tensors, 1000 replicates of SVD calculation using the structural noise Monte-Carlo method ('-mcStruc') within PALES ${ }^{10}$ are shown.

Table S4. Experimental PCSs (ppm) for tagged ubiquitin E24C/A28C.
