## 1. General Information

All oxygen or moisture sensitive reactions were carried out under inert atmosphere (nitrogen or argon) with rigid exclusion of moisture. All the commercially available reagents and catalysts were used without further purification. Reaction solvents were purchased in anhydrous form, except for THF (tetrahydrofuran) which was distilled from $\mathrm{Na} /$ benzophenone. Flash column chromatography was performed using the indicated solvents on Qingdao Haiyang silica gel (200-300 mesh). Analytical thin-layer chromatography (TLC) was carried out using pre-coated sheets (Sanpontgroup silica gel, 0.2 mm ) which, after development, were visualized at 254 nm , and/or staining in $p$-anisole, ninhydrin or phosphomolybdic acid solution followed by heating. NMR spectra were recorded on Bruker AscendTM 500MHz or Bruker AscendTM 400MHz spectrometers. Chemical shifts were reported in parts per million (ppm), relative to either a tetramethylsilane (TMS) internal standard or the signals of the residual solvent. Data were reported as follows: chemical shift, multiplicity ( $\mathrm{s}=$ singlet, $\mathrm{d}=$ doublet, $\mathrm{t}=$ triplet, $\mathrm{q}=$ quartet, $\mathrm{br}=$ broad), coupling constants $(\mathrm{Hz})$ and integration. High-resolution ESI mass spectra were obtained using a Q-Exactive mass spectrometer. Optical rotations were recorded on a Rudolph AutoPol I Polarimeter.

### 2.1 Synthesis of the Common Intermediate 6

To a stirred solution of allylic bromide $\mathbf{1 0}^{1}(5.0 \mathrm{~g}, 26.0 \mathrm{mmol})$ in dry DMF ( 125 mL ) was added $\mathrm{Cs}_{2} \mathrm{CO}_{3}(17.0 \mathrm{~g}, 52.2 \mathrm{mmol})$ and $\mathrm{PMBNH}_{2}(13.6 \mathrm{~mL}, 104.1 \mathrm{mmol})$ at room temperature. Then the reaction was heated to $50^{\circ} \mathrm{C}$ and stirred for 2 h . The resulting mixture was diluted with ethyl acetate $(500 \mathrm{~mL})$ and washed with water $(5 \times 100 \mathrm{~mL})$ and brine (100 mL ). The organic layer was dried over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated in vacuo. The residue was purified by silica gel flash chromatography to give allylic amine 11 ( $5.4 \mathrm{~g}, 84 \%$ ) as a light yellow oil.

The reaction mixture was allowed to warm to room temperature and stirred for 3 h . The mixture was concentrated in vacuo to give crude intermediate 17 , which was used in the next step without further purification

To a solution of crude intermediate $\mathbf{1 7}$ in $\mathrm{MeOH}(2.0 \mathrm{~mL})$ at $0{ }^{\circ} \mathrm{C}$ was bubbled with freshly prepared $\mathrm{HCl}(\mathrm{g})$ for 2 min .
