Supporting Information

Reagents

Bis(diphenylphosphino)methane (dppm), bis(dimethylphosphino)methane (dmppm), and Pd(O₂CCH₃)₂ were purchased from Sigma Aldrich and used without further purification. Acetic acid-1-¹³C and acetic acid-d₄ were obtained from Isotech and Cambridge Isotopes respectively.

The desired precursor complexes, [CH₃CO₂Pd((PR₂)₂CH₂)]⁺, were typically generated by combining stock solutions of 5 mM palladium acetate in methanol with 5 mM ligand (dppm or dmppm) in methanol at 1:1 ratio followed by 10-fold dilution with methanol resulting in a theoretical complex concentration of 0.5 mM. For experiments utilizing a labeled acetate ligand, the requisite acid was added to this solution in 10-fold molar excess. The solutions were vortexed and allowed to sit for 5 min prior to analysis.

Mass spectrometry experiments

All experiments with the dppm ligand were carried out using a commercially available Finnigan LTQ linear ion trap fitted with the standard factory electrospray ionization source described in detail elsewhere.¹ Solutions prepared as above were introduced into the mass spectrometer at 3.0 μ L/min via ESI. Typical ESI conditions used were: positive ion mode; spray voltage, 4.5 kV; capillary temperature, 300 °C; nitrogen sheath pressure, 10-20 (arbitrary units). The capillary voltage and the tube lens offset were tuned to maximise the desired peak. The injection time was set using the automatic gain control function. For the multistage mass spectrometry (MSⁿ) experiments, the desired ions produced via ESI were trapped in the LTQ and subjected to CID at a He bath gas pressure of ca. 5 x 10⁻³ Torr. Low-energy CID was carried out by mass selecting the desired ions with a 0.8-1.0 *m/z* units window and subjecting them to multiple collisions with the He bath gas using the following typical conditions: normalised collision energy between 16% and 40%, which determines the translational kinetic

energy of the ions; activation (Q), 0.25, which assigns the radio-frequency (RF) used to fragment ions, and activation time of 30 ms that is the time set to excite the ions via CID.

All experiments with the dmpm ligand were carried out using a commercially available Bruker Esquire 3000 ion trap mass spectrometer. Samples prepared as described above were introduced via ESI to the mass spectrometer at a flowrate of 3.0 $\mu\text{L}/\text{min}$. Source parameters were set to 12 PSI, 4.0kV respectively for the nebulizer pressure and the needle voltage and the source temperature was maintained at 250 $^{\circ}\text{C}$. All other tunable instrument parameters were optimized to give the maximum yield of the desired complex ion. Tandem mass spectrometry experiments utilized CID, with the helium bath gas pressure unmodified from normal usage. Isolation of the desired precursor ion was achieved with isolation windows of 0.8-1.3 m/z units. Fragmentation amplitudes ranged from 0.4 to 0.8 V and were optimised for generation of the product ion while ensuring that 15-25 % of the precursor ion remained.

Gas-phase Infrared Spectroscopy Experiments

IRMPD spectroscopy was performed employing a commercial Bruker Esquire 3000+ quadrupole ion trap mass spectrometer into which pulsed IR light is coupled. The detailed layout of this experimental apparatus is described elsewhere.² IR spectroscopy in the 1000–2000 cm^{-1} spectral range was carried out using the free electron laser (FEL) at CLIO.³ Desired mass-selected ions are trapped in a 3D ion trap where ions normally are collisionally thermalised by high-purity helium buffer gas. The ions are then irradiated by the FEL. Upon resonant vibrational excitation, dissociation of the selected decarbonylated $[\text{CH}_3\text{CO}_2^{106}\text{Pd}((\text{PPh}_2)_2\text{CH}_2)]^+$, **1a**-CO, was monitored via the formation of fragment peaks at m/z 305 and 397, which are the same ions formed upon CID (see Figures S1 below). The abundances of these photofragments and their corresponding precursors were recorded as a

function of the IR wavelength in order to derive the IR action spectra, where the IRMPD efficiency is plotted against the photon energy.

Computational Methods

Standard DFT calculations were carried out with Gaussian 09.⁴ Starting geometries for the complexes $[\text{CH}_3\text{CO}_2\text{Pd}((\text{PR}_2)_2\text{CH}_2)]^+$, **1a** and **1b**, were assumed to be the most stable square planar four coordinate complexes, which were allowed to fully optimize. The geometries of species associated with the decarboxylation pathway were chosen based on the previously calculated decarboxylation of the related $[\text{CH}_3\text{CO}_2\text{Pd}(\text{phen})]^+$ system.⁵ For the decarbonylation pathways, several geometries were considered that allowed one of the P atoms of the bisphosphine ligand to interact with one of the O atoms of the acetate ligand. For example, a higher energy pathway that connects **1b** and the key intermediate **7b** via **TS1b-7b** was found but since this is higher in energy (63.5 kcal/mol) than the highest energy decarboxylation **TS12b-13b** (36.7 kcal/mol), this is unlikely to operate under the low energy CID conditions of the ion trap mass spectrometer. The related pathways for **1a** are shown in Figure S5.

Geometries for all structures were optimized with the M06 procedure⁶ with the 6-31G(d) basis set for all C, H, P and O atoms and the SDD basis set for the Pd atom.⁷ Following each geometry optimization, harmonic frequency analysis was carried out to confirm the nature of the stationary point as an equilibrium structure (no imaginary frequencies) or a transition structure (one imaginary frequency) and to determine the zero-point vibrational energies (E_{zpe}), which were used to calculate the reaction energies: $E_{reported} = E_{electronic} + E_{zpe}$. IRC calculations and potential energy surface scans were performed on transition states to confirm that they

connect the stated reactants and products. The calculated vibrational frequencies were scaled using 0.98 scale factor.

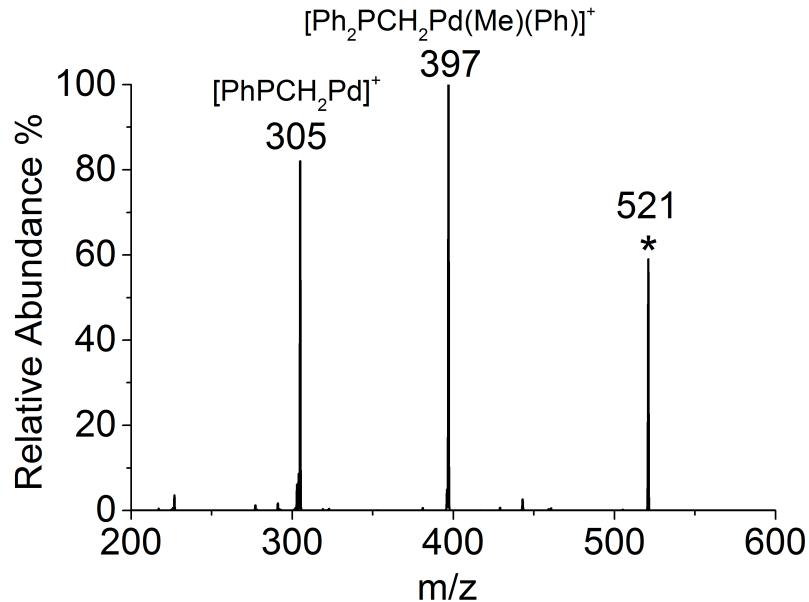

Figure S1: LTQ MS³ CID spectrum of $[\text{CH}_3\text{CO}_2^{106}\text{Pd}((\text{PPh}_2)_2\text{CH}_2) - \text{CO}]^+$, **1b-CO**. The mass-selected precursor is marked with an asterisk.

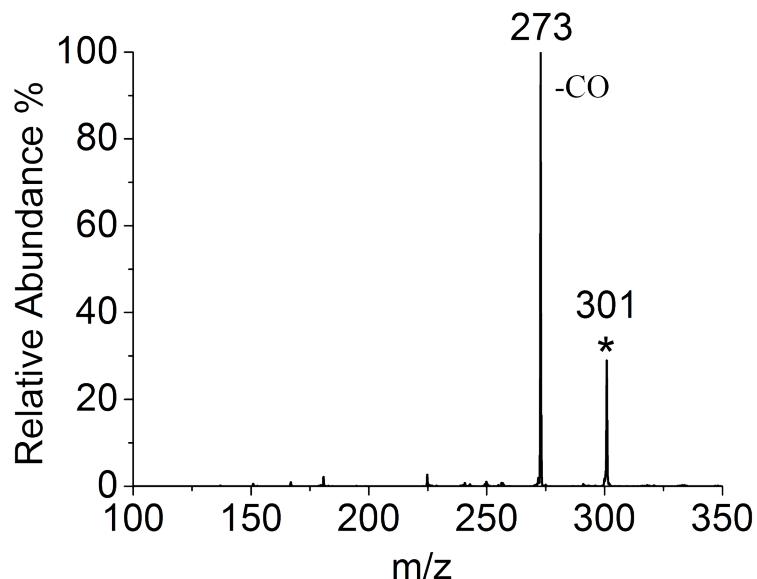

Figure S2: Esquire 3000 MS² CID spectrum of $[\text{CH}_3\text{CO}_2^{106}\text{Pd}((\text{PMe}_2)_2\text{CH}_2)]^+$, **1b**. Product ion is labelled according to the neutral fragment that was lost from the mass-selected precursor, which is marked with an asterisk.

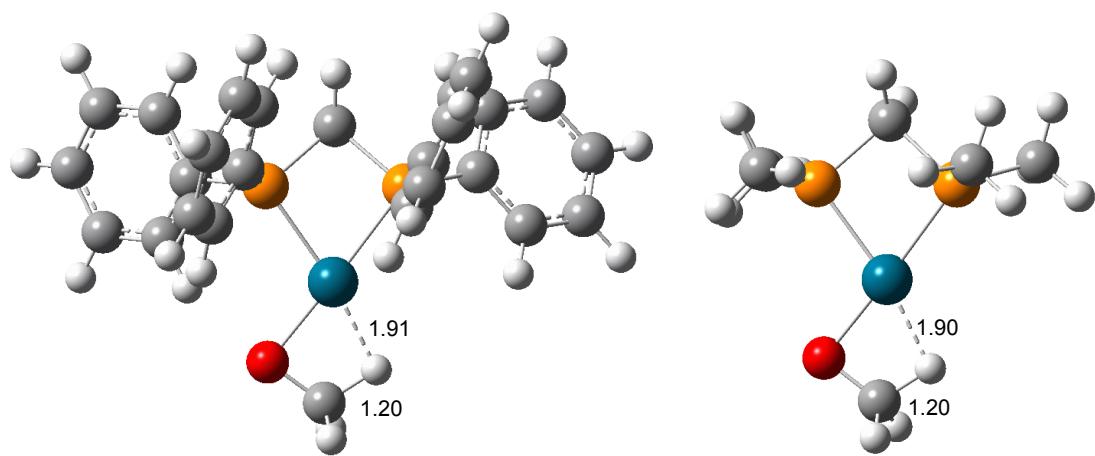

Figure S3: DFT calculated structures of isomers $[\text{CH}_3\text{OPd}((\text{PMe}_2)_2\text{CH}_2)]^+$, **4a** (left) and **4b** (right) at the M06/SDD6-31G(d) level of theory showing agostic interactions.

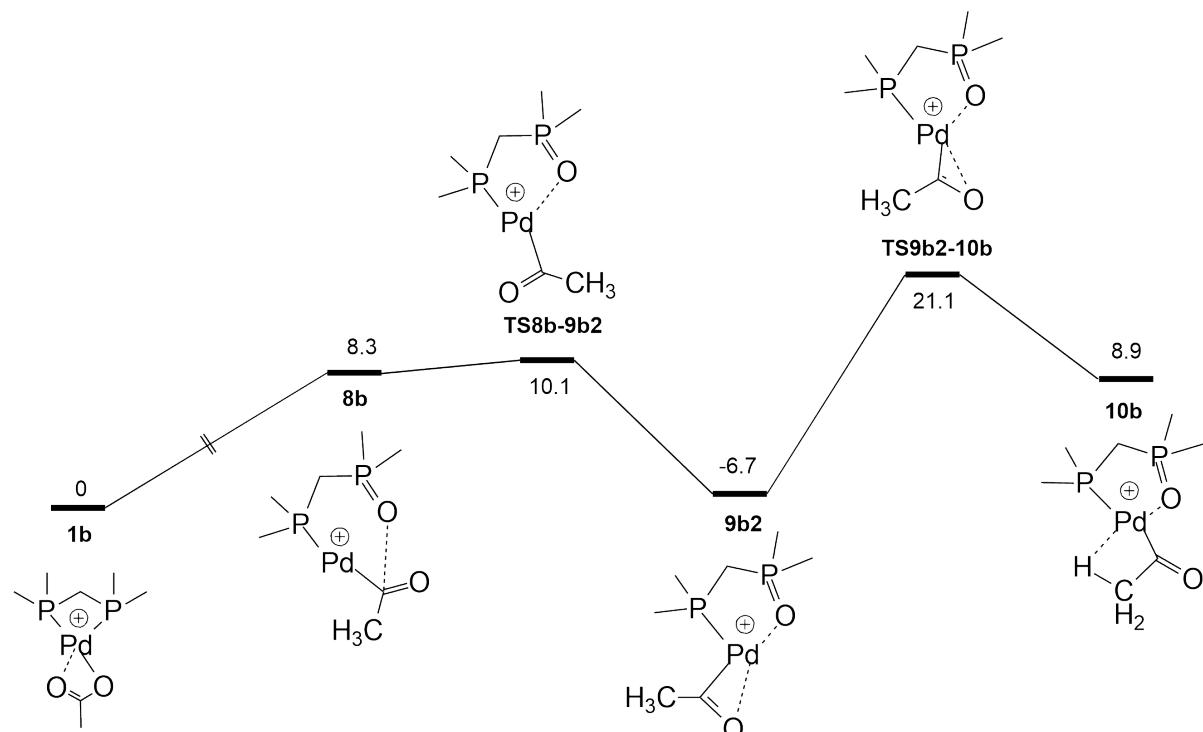

Figure S4: Alternative higher energy pathway to isomerize **8b** to **10b** at the M06/def2-TZVP//M06/SDD6-31G(d) level of theory. Energies are in kcal/mol and are given as ΔE .

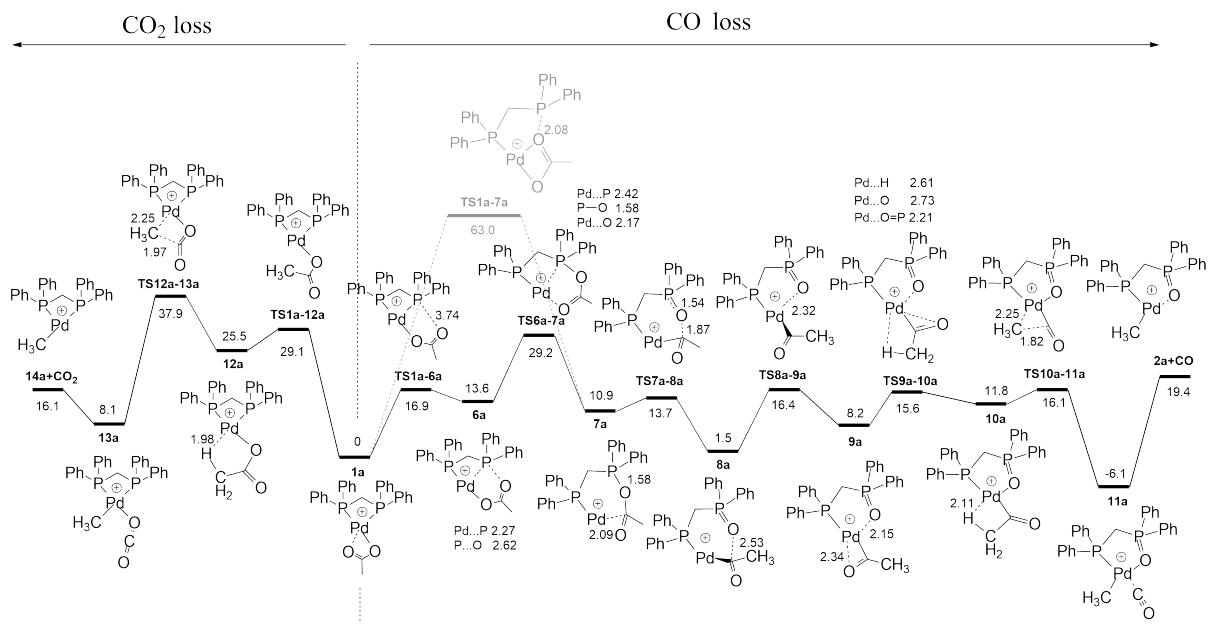

Figure S5: Results of DFT calculations on the competition between decarboxylation and decarbonylation of $[\text{CH}_3\text{CO}_2\text{Pd}((\text{PPh}_2)_2\text{CH}_2)]^+$, **1b** at the M06/def2-TZVP//M06/SDD6-31G(d) level of theory. Energies are in kcal mol⁻¹ and are given as ΔE .

Table S1: IRMPD experimental and theoretical vibrational frequency of three $[\text{CH}_3\text{CO}_2^{106}\text{Pd}((\text{PPh}_2)_2\text{CH}_2) - \text{CO}]^+$ isomers, **2**, **3** and **4**.
