

Electronic Supplementary Information for “A Ground State Potential Energy Surface for HONO based on a Neural Network with Exponential Fitting Functions”

Ekadashi Pradhan^a and Alex Brown^{a*}

S0 Fit to 1D Potential Energy Curves

To obtain the sum over 1D energies, $V_{tot}^0(x_i)$, the potentials for the bond distances were fit to Morse functional form:

$$V(r_i) = A_0[1 - e^{-A_1(r_i - A_2)}]^2. \quad (1)$$

The bond angles (in their cosine form) were fit to a 4th order polynomial, i.e.,

$$V(\cos \theta_i) = A_0 + A_1 \cos(\theta_i) + A_2(\cos \theta_i)^2 + A_3(\cos \theta_i)^3 + A_4(\cos \theta_i)^4. \quad (2)$$

The dihedral angle was fit to cos(nx) form:

$$V(\phi) = A_0 + A_1 \cos(\phi) + A_2 \cos(2\phi) + A_3 \cos(3\phi) + A_4 \cos(4\phi). \quad (3)$$

The fitting parameters are presented in Tables S1 and S2. As discussed in the main text, the energy filtering was performed using only the 1D potential fits from the trans geometry; however, data for both the trans- and cis-isomers is presented here.

Table S1 Fitting Parameters of bond lengths (in au) for trans- and cis-HONO

Fitting Parameter	A ₀	A ₁	A ₂
trans-HONO			
R _{N=O}	0.234724	1.3613	2.2109

^a Several of the references contain equilibrium geometries computed with multiple methods and basis sets. Generally only the values determined using the highest level(s) of theory are reported here. ^b Provided as given in the original paper but when compared to other values, suggests that the trans- and cis- labels may have been inadvertently switched.

Table S4 CCSD(T)-F12/cc-pVTZ-F12 (F12) optimized geometries including bond distances (\AA) and angles (degrees), of HNO_2 , $\text{TS}_{\text{trans} \leftrightarrow \text{HNO}_2}$ and $\text{TS}_{\text{HONO} \leftrightarrow ^1,^3\text{HONO}}$. Also provided are experimental and previous theoretical results.
