Figure 1 depicts rotationally resolved state-to-state reaction probability at a specific final vibrational state ($v' = 0$) of OH diatom for the title reaction starting from the initial rovibrational state $v = 0, j = 1$ of the O₂ diatom at four different collision energies, *viz.*, $E_c = 0.5$ eV, 1.0 eV, 1.5 eV and 2.0 eV. One can clearly see that the reaction probabilities are very small at $E_c = 0.5$ eV, which essentially is the signature of existence of the threshold value for opening of the product channel. Moreover, as the collision energy increases, the state-to-state reaction probabilities also gradually increases, which is consistent with the feature of the total reaction probability profile [see Fig. 1 of the main text]. The general feature of the profiles is that all of them start with some moderate value, goes through some maxima and then gradually diminishes at higher j 's. Also, it is quite evident that the reaction probabilities are well converged within the collision energies of our consideration. As expected, the convergence profiles of reaction probabilities becomes gradually right shifted with the increase of collision energy indicating the requirement of more j 's at higher collision energy. On the other hand, the convergence profiles of rotationally resolved reaction probabilities at $v' = 1$ are shown in Figure 2, where the trends of the profiles at those four collision energies are similar to that of Figure 1, except the fact that the profiles converges faster with respect to j' . Moreover, the magnitudes of the reaction probabilities at most of the collision energies are lesser as compared to the $v' = 0$ case.

On the other hand, Figure 3 displays the rotationally summed vibrationally resolved reaction probabilities at four different collision energies, $E_c = 0.5$ eV, 1.0 eV, 1.5 eV and 2.0 eV for the title reaction starting from the

initial rovibrational state $v = 0, j = 1$ of the O₂ diatom. Here, in all the energies, the profiles generally starts with a higher value and then gradually diminishes as v' increases. Moreover, as the collision energy increase, the v' required for convergence also increases. One can clearly see that the profiles are well converged within the range of v' ($= 0 - 10$) considered in our calculation.

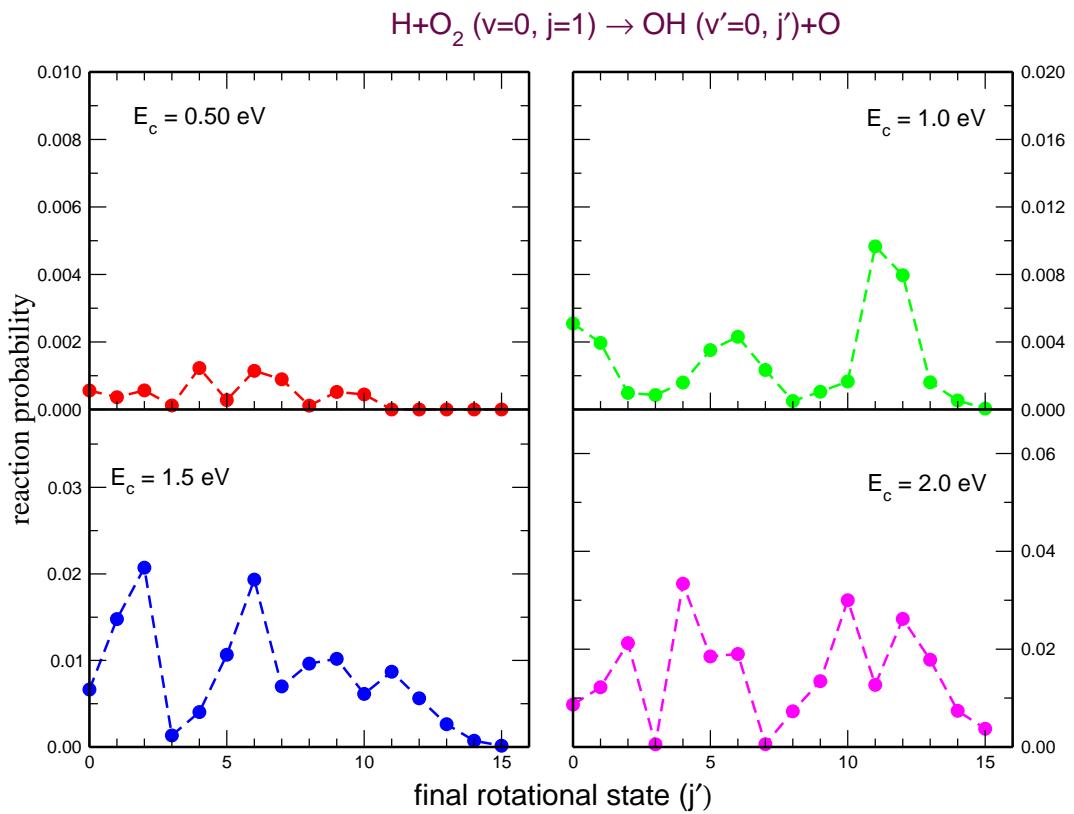

Figure 1: Rotationally resolved state-to-state reaction probability for $\text{H} + \text{O}_2 (v=0, j=1) \rightarrow \text{OH} (v'=0) + \text{O}$ reaction as a function of various final rotational states, *viz.*, $j' = 0 - 15$ at four different collision energies (0.5 eV, 1.0 eV, 1.5 eV and 2.0 eV).

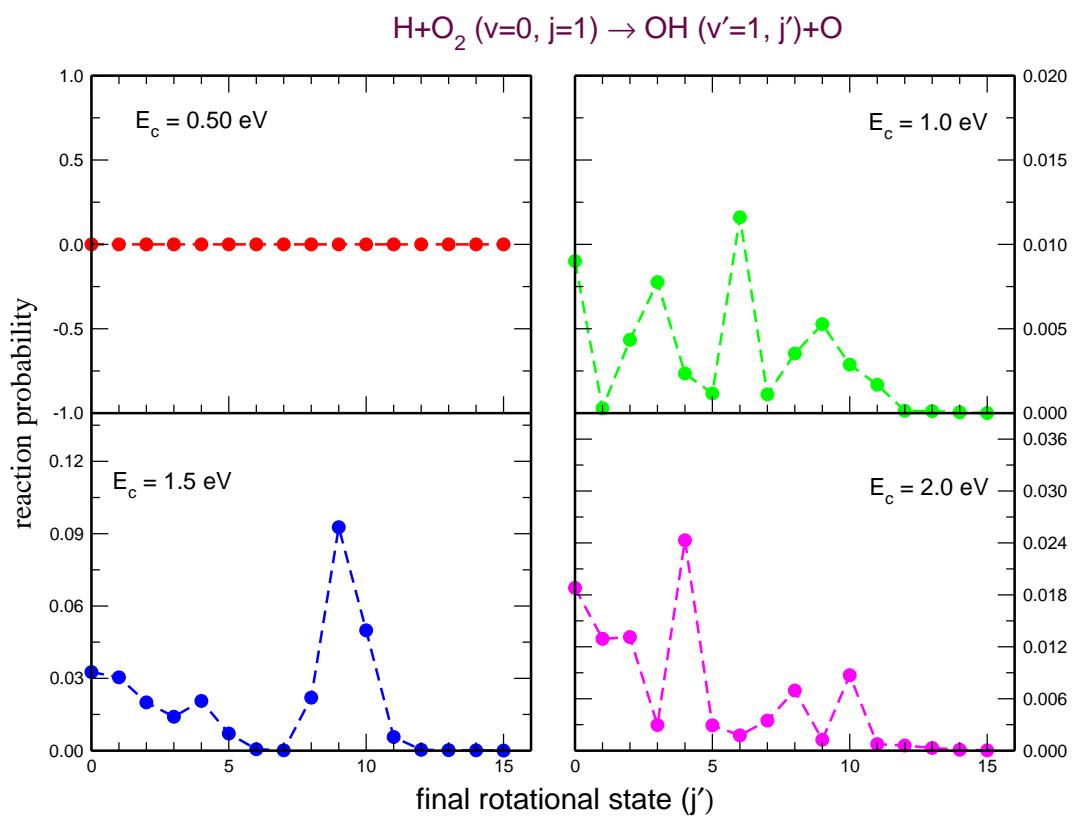

Figure 2: Same as Fig. 1, but for $\nu' = 1$.

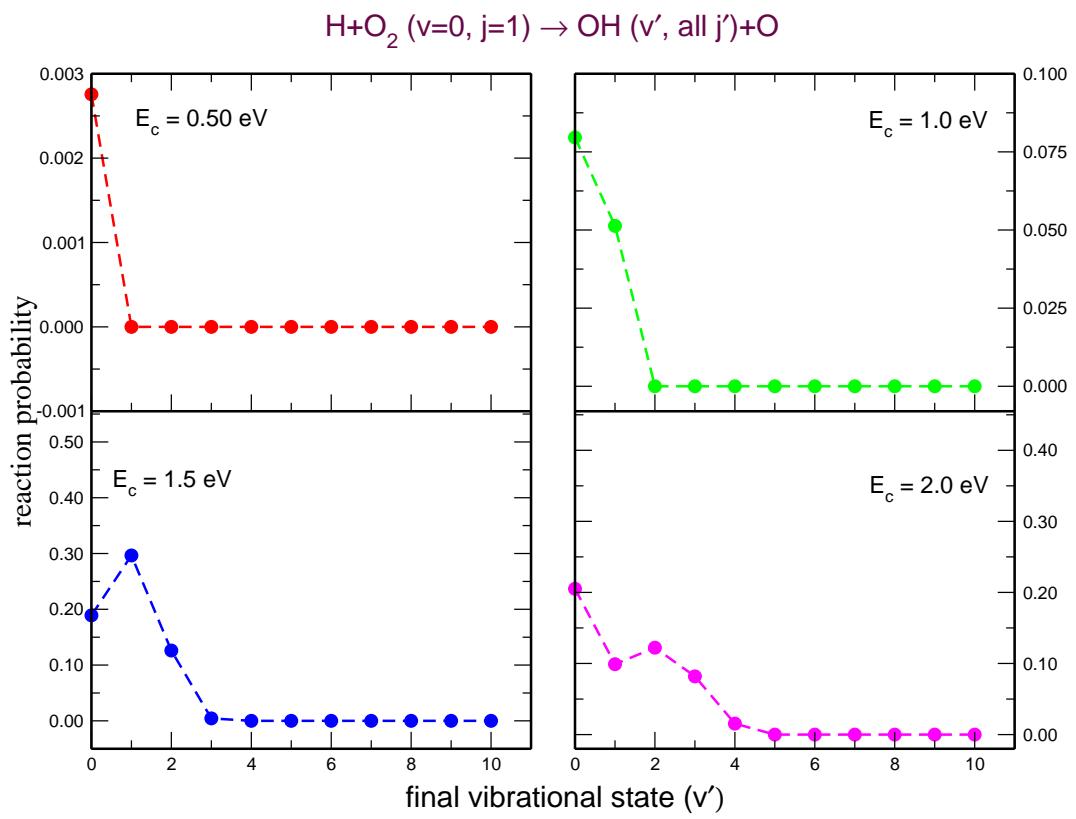

Figure 3: State-to-state reaction probability for $\text{H} + \text{O}_2 (\nu=0, j=1) \rightarrow \text{OH} (\nu', j') + \text{O}$ reaction at various final vibrational states, *viz.*, $\nu' = 0 - 10$.

Table 1: Data for initialization, projection, and absorbing potential discussed in the text: H + O₂ ($v = 0, j = 1; J = 0$)

Grid size:		
N_ρ		256
N_θ		64
N_ϕ		128
$(\rho_{min}, \rho_{max})/\text{\AA}$		(1.0, 12.0)
Translational wave packet:		
$R_0/\text{\AA}$		6.50 ($\sim 7.55)^a$
$\sigma/\text{\AA}$		0.21
$k_0 (\text{\AA}^{-1})$		29.00772
Initial state:		
E_{vj} (eV)		0.097909
Propagation:		
Δt (10^{-16} s)		0.50
Magnitude of the five last Lanczos vectors ^b		$10^{-8} - 10^{-7}$
Absorbing potential:		
V_{opt}/eV		0.163
$\rho_I (\text{\AA})$		10.5
Range of the absorbing potential (\AA)		10.5 - 12.0
Projection:		
R^* (\AA)		3.5 ($\sim 4.45)^a$
vib. states		$v' = 0, \dots, 10$
rot. states		$j' = 0, \dots, 15$
Rotational Constants of O...OH Complex:		
	CHIPR PES	DMBE IV PES
$A^\ddagger (\text{cm}^{-1})$	35.51	44.95
$B^\ddagger (\text{cm}^{-1})$	0.249	0.289
Maximum Value of Total Angular Momentum:		
J_{max}		63

^a The transformed values of various parameters in ρ - space are shown in the parenthesis.

^b All vectors are normalized.
